current, coming from latitudes farther north, rolls in through the Golden Gate, bringing with it fogs that spread themselves over the estuary inside. Although not frosty, these are cold enough to be uncomfortable, and the haze now is accompanied by a chill drizzling rain. Standing under it, Harry Blew feels he is fast getting wet. If he do not obtain shelter, he will soon be soaked to the skin. Looking around, his eye rests upon a boat, which lies bottom upward on the beach. It is an old ship's launch that has bilged, and either been abandoned as useless, or upturned to receive repairs. No matter what its history, it offers him the hospitality so scurvily refused by the Sailor's Home. If it cannot give him supper, or bed, it will be some protection against the rain that has now commenced coming down in big clouting drops. This deciding him, he creeps under the capsized launch, and lays himself at full length along the shingle.

The spot upon which he has stretched himself is soft as a leather-bed. Still he does not fall asleep. The rain, filtering through the sand, soon finds its way under the boat; and, saturating his couch, makes it uncomfortable. This, with the cold night-air, keeps him awake. He lies listening to the sough of the sea, and the big drops pattering upon the planks above. Not long before other sounds salute his ear, distinguishable as human voices—men engaged in conversation. As he continues to listen, the voices grow louder, those who converse evidently drawing nearer. In a few seconds they are by the boat's side, where they come to a stand. But though they have paused in their steps, they continue to talk in an excited, earnest tone. So loud that he can hear every word they say; though the speakers are invisible to him. The capsized boat is not so flush with the sand, as to prevent him from seeing the lower part of their legs, from below the knees downward. Of these there are four pairs, two of them in trousers of the ordinary kind; the other two in *calzoneras* of velvetene bordered at the bottom with black stamped leather. But, that all four men are Californians or Spaniards, he can tell by the language in which they are conversing—Spanish. A lucky chance that he understands something of this—if not for himself, for the friends who are dear to him.

The first intelligible speech that reaches his ear is an interrogatory:

'You're sure, Calderon, they'll come this way?'

'Quite sure, De Lara. When I stood by them at the hotel-bar, I heard the younger of the two tell one of the American officers that their boat was to meet them at the wooden *muello*—the new pier, as you know. To reach that, they must pass by here; there's no other way. And it can't be long before they make appearance. They were leaving the hotel at the time we did, and where else should they go?'

'No knowing'—this from the voice of a third individual. 'They may stay to take another *copita*, or half a dozen. These Ingleses can drink like fish, and don't seem to feel it.'

'The more they drink, the better for us,' remarks a fourth. 'Our work will be the easier.'

'It may not be so easy, Don Manuel,' puts in De Lara. 'Young as they are, they're very devils both. Besides, they're well armed, and will battle like grizzly bears. I tell you, *camaradas*,

we'll have work to do before we get back our money.'

'But do you intend killing them, De Lara?' asks Calderon.

'Of course. We must, for our own sakes. 'Twould be madness not, even if we could get the money without it. The older, Crozier, is enormously rich, I've heard; could afford to buy up all the law there is in San Francisco. If we let them escape, he'd have the police after us like hounds upon a trail. Even if they shouldn't recognise us now, they'd be sure to suspect who it was, and make the place too hot to hold us. *Caspiata!* It's not a question of choice, but a thing of necessity. *We must kill them!*'

Harry Blew hears the cold-blooded determination, comprehending it in all its terrible significance. It tells him the young officers are still in the town, and that these four men are about to waylay, rob, and murder them. What they mean by 'getting back the money' is the only thing he does not comprehend. It is made clear as the conversation continues.

'I'm sure there's nothing unfair in taking back our own. I, Frank Lara, say so. It was they who brought about the breaking of our bank, which was done in a mean dastardly way. The Englishman had the luck, and all the others of his kind went with him. But for that, we could have held out. It's no use our whining about it. We've lost, and must make good our losses best way we can. We can't, and be safe ourselves, if we let these *gringos* go.'

'*Chinyara!* we'll stop their breath, and let there be no more words about it.'

The merciless verdict is in the voice of Don Manuel.

'You're all agreed, then?' asks De Lara.

'*Si, si, si!*' is the simultaneous answer of assent, Calderon alone seeming to give it with some reluctance; though he hesitates from timidity, not mercy.

Harry Blew now knows all. The officers have been gaming, have won money, and the four fellows who talk so coolly of killing them are the banker and his confederates. What is he to do? How can he save the doomed men. Both are armed; Crozier has his sword, Cadwallader his dirk. Besides, they have pistols, as he saw while they were talking to him at the Sailor's Home. But then they are to be taken unawares—shot or struck down in the dark without a chance of seeing the hand that strikes them! Even if warned and ready, it would be two against four. And he is himself altogether unarmed; for his jack-knife is gone—hypothecated to pay for his last jorum of grog! And the young officers have been drinking freely, as he gathers from what the ruffians have said. They may be inebriated, or enough so to put them off their guard. Who would be expecting assassination? Who ever is, save a Mexican himself? Altogether unlikely that they should be thinking of such a thing. On the contrary, disregarding danger, they will come carelessly on, to fall like ripe corn before the sickle of the reaper. The thought of such a fate for his friends, fills the sailor with apprehension; and again he asks himself how it is to be averted.

The four conspirators are not more than a few feet from the boat. By stretching out his hands he could grip them by the ankles, without

altering his recumbent attitude one inch. By doing this, he might give the guilty plotters such a scare as would cause them to retreat, and so baffle their design. The thought flits across his brain, but is instantly abandoned. They are not of the stuff to be frightened at shadows. By their talk, at least two are desperadoes, and to make known his presence would be only to add another victim to those already doomed to death. What is he to do? For the third time he asks himself this question, still unable to answer it. While painfully cogitating, his brain labouring to grasp some feasible plan of defence against the threatened danger, he is warned of a change. Some words spoken tell of it. It is De Lara who speaks them.

'By the way, *camarados*, we're not in a good position here. They may sight us too soon. To make things sure, we must drop on them before they can draw their weapons. Else some of us may get dropped ourselves.'

'Where could we be better? I don't see. The shadow of this old boat favours us.'

'Why not crawl under it?' asks Calderon. 'There Argus himself couldn't see us.'

Harry Blew's heart beats at the double-quick. His time seems come, and he already fancies four pistols at his head, or the same number of poniards pointing to his ribs.

It is a moment of vivid anxiety—a crisis dread, terrible, almost agonising. Fortunately, it is not of long duration, ending almost on the instant. He is relieved at hearing one of them say: 'No; that won't do. We'd have trouble in scrambling out again. While about it, they'd see or hear us, and take to their heels. You must remember, it's but a step to where their boat will be waiting them, with some eight or ten of those big British tars in it. If they got there before we overtook them, the tables would be turned on us.'

'You're right, Don Manuel,' rejoins De Lara; 'it won't do to go under the boat, and there's no need for us to stay by it. *Mira!* yonder's a better place—by that wall. In its shadow no one can see us, and the *gringos* must pass within twenty feet of it. It's the very spot for our purpose. Come!'

No one objecting, the four figures start away from the side of the boat; and, gliding silently as spectres across the strip of sandy beach, disappear within the dark shadow of the wall.

#### CHAPTER XXV.—CRUSADERS, TO THE RESCUE.

'What am I to do?' It is the ex-man-o'-war's man, still lying under the launch, who thus interrogates himself; for the fourth time, and more emphatically than ever; but also in less dubious accent, and less despairingly. True, the conspiring assassins have only stepped aside to a spot from which they may more conveniently descend upon their quarry, and be surer of striking it. But their changed position has left him free to change his; which he at length determines upon doing. Their talk has told him where the man-of-war's boat will be awaiting to take the officers back to their ship. He knows the new wharf referred to, the very stair at which the Crusaders have been accustomed to bring their boats to. It may be the cutter with her full crew of ten—or it may be but the gig. No matter which. There

cannot be fewer than two oarsmen, and these will be sufficient. A brace of British tars, with himself to make three, and the officers to tot up five—that will be more than a match for four Spanish Californians. Four times four, thinks Harry Blew, even though the sailors, like himself, be unarmed, or with nothing but their knives and boat-hooks. He has no fear, if he can but bring it to an encounter of this kind. The question is, can he do so? And first, can he creep out from under the launch, and steal away unobserved? A glance from under his sheltering boat towards the spot where the assassins have placed themselves in ambuscade, satisfies him that he can. The fog favours him. Through it he cannot see them; and should be himself equally invisible. Another favourable circumstance: on the soft, sandy beach his footsteps will make but slight noise; not enough to be heard above the continuous surging of the surf. All this passes in a moment, and he has made up his mind to start; but is staid by a new apprehension. Will he be in time? The stair at which the boat should be is not over a quarter of a mile off, and will take but a few minutes to reach it. Even if he succeed in eluding the vigilance of the ambushed villains, will it be possible for him to get to the pier, communicate with the boat's crew, and bring them back, before the officers reach the place of ambush? To this, the answer is doubtful, and the doubt appals him. In his absence, the young gentlemen may arrive at the fatal spot. He may return to find their bodies lying lifeless along the sand, their pockets rifled, the plunderers and murderers gone!

The thought holds him irresolute, hesitating what course to take. Shall he remain till they are heard approaching, then rush out, and give them such warning as he may, throw himself by their side, and do his best to defend them? Unarmed, this would not be much. Against pistols and poniards he would scarce count as a combatant. It might but end in all three being slaughtered together! And there is still a danger of his being discovered in his attempt to steal away from his place of concealment. He may be followed, and overtaken; though he has little fear of this. Pursued he may be, but not overtaken. Despite his sea-legs, he knows himself a swift runner. Were he assured of a fair start, he will hold his distance against anything Spanish or Californian. In five minutes he can reach the pier—in five more be back. If he but find the *Crusaders* there, a word will warn them. In all it might take about ten minutes. But, meanwhile, Crozier and Cadwallader may get upon the ground, and one minute after that all would be over. A terrible struggle agitates the breast of the old man-o'-war's man; in his thoughts is a conflict agonising. On either side are *pros* and *cons*, requiring calm deliberation; and there is no time for this. He must act.

But one more second spent in consideration. He has confidence in the young officers. Both are brave as lions, and if attacked, will make a tough fight of it. Crozier has also caution, on which dependence may be placed; and at such a time of night he will not be going unguardedly. The conflict, though unequal, might last long enough for him, Harry Blew, to bring the *Crusaders* at least near enough to cry out, and cheer their officers with the hope of help at hand. All

this passes through his mind in a tenth part of the time it takes to tell it. And having resolved how to act, he hastens to carry out his resolution—which is to proceed in quest of the boat's crew.

Sprawling out like a lizard from beneath the launch, he glides off silently along the strand. At first, with slow cautious steps, and crouchingly; but soon erect, in a rapid run, as if for the saving of his life; for it is to save the lives of others, almost dear as his own. The five minutes are not up, when his footsteps patter along the planking of the hollow wooden wharf. In ten seconds after, he stands at the head of the sea-stairway, looking down. Below is a boat with men in it, half-a-score of them seated on the thwarts, some lolling over against the gunwales, asleep. At a glance he can tell them to be *Crusaders*. His hail startles them into activity, one and all recognising the voice of their old shipmate. 'Quick!' he cries; 'quick, mates! Come along with me! Don't stay to ask questions. Enough for you to know that the lives of your officers are in danger.'

It proves enough. The tars don't wait for a word more; but spring up from their recumbent attitude, and out of the boat. Rushing up the steps, they cluster around their comrade. They have not needed instructions to arm themselves. Harry's speech, with its tone, tells of some shore hostility, and they have instinctively made ready to meet it. Each has laid hold of the weapon nearest to his hand; some a knife, some an oar, others a boat-hook.

'Heave along with me, lads!' cries Blew; and they 'heave' at his heels—rushing after, as if to extinguish a fire in the fore-castle.

Soon they are coursing along the strand, towards the upturned boat, silently, and without asking explanation. If they did, they could not get it; for their leader is panting, breathless, almost unable to utter a word. But five fathoms from his throat, jerked out disjointedly, and in hoarse utterance. They are: 'Crozier—Cadwallader—way-laid—robbers—murderers!'

Enough to spur the *Crusaders* to their best speed, if they had not been already at it. But they are; every man of them straining his strength to the utmost. As they rush on, clearing the thick fog, Harry at their head listens intently. As yet he hears no sound; only the monotonous swashing of the sea, and the murmur of distant voices in the streets of the town. But no cries—no shouts, nor shots; nothing to tell of deadly strife.

'Thank the Lord!' says the brave sailor, half speaking to himself; 'we'll be in time to save them.' The words have scarce passed from his lips, when he comes in sight of the capsized launch; and simultaneously he sees two figures upon the beach beyond. They are of human shape, but through the fog looking large as giants. He is not beguiled by the deception; he knows them to be the forms of the two officers magnified by the mist. No others are likely to be coming that way; for he can perceive they are approaching; and, as can be told by their careless, swaggering gait, unsuspecting of danger, little dreaming of an ambuscade, that in ten seconds more may deprive them of existence.

To him, hurrying to prevent this catastrophe; it is a moment of intense apprehension—of dread—chilling fear. He sees the young officers almost up

to the place where the assassins should spring out upon them. In another instant he may hear the cracking of pistols, and see their flashes through the fogs. Expecting it even before he can speak, he nevertheless calls out: 'Halt there, Mr Crozier! We're *Crusaders*. Stop where you are. Another step, and you'll be shot at. There's four men under that wall waiting to murder ye. D'ye know the names—Calderon and Lara? It's them!'

At the first words, the young officers—for it is they—instantly stop. The more promptly from being prepared to anticipate an attack, but without the warning. Well timed it is; and they have not stopped a moment too soon. Simultaneous with the sailor's last speech, the sombre space under the wall is lit up by four flashes, followed by the report of as many pistols, while the 'tzip-tzip' of bullets, like hornets hurtling past their ears, leaves them no doubt as to who has been fired at. Fired at, and fortunately missed; for neither feels hurt nor hit! But the danger is not yet over. Quick following the first comes a second volley, and again with like result. Bad marksmen are they who design doing murder. It is the last. In all likelihood, the pistols of the assassins are double-barrelled, and both barrels have been discharged. Before they can reload them, Harry Blew with the *Crusaders* have come up, and it is too late for De Lara and his confederates to employ their poniards. Crozier and Cadwallader bound forward; and placing themselves at the head of the boat's crew, advance toward the shadowed spot. The young officers have long since drawn their pistols, but prudently retained their fire, seeing nothing sure to aim at. Now, they go with a rush, resolved on coming to close quarters with their dastardly assailants, and bringing the affair to a speedy termination. But it is over already, to their surprise, as also chagrin. On reaching the wall, they find nothing there save stones and timber. The dark space, for an instant illuminated by the pistol-flashes, has resumed its grim obscurity. The assassins have got away, escaping the chastisement they would surely have received had they stood their ground. Some figures are seen in the distance, scuttling along a narrow lane. Crozier brings his revolver to bear on them, his finger upon the trigger. But it may not be them; and staid by the uncertainty, he refrains from firing. 'Let them go!' he says, returning the pistol to his pocket. 'I would be no use looking for them now. Their crime will keep till morning; and since we know their names, it will be strange if we can't find them; though not so strange if we should fail to get them punished. That they shall be, if there's a semblance of law to be found in San Francisco.—Now, thanks, my brave *Crusaders*! And there's a hundred pound note to be divided among you. Small reward for the saving of two lives, with a goodly sum of money. Certainly, had you not turned up so opportunely.—But how came you to be here? Never mind now! Let us get aboard; and you, Blew, must come with us. It'll do you no harm to spend one more night on your old ship. There you can tell me all.'

Harry joyfully complies with a requisition so much to his mind; and, instead of tossing discontentedly on a couch of wet sand, he that night sleeps soundly in his old bunk in the frigate's fore-castle.

#### CHAPTER XXVI.—IN FLIGHT.

A country-house ten miles distant from San Francisco, in a south-westerly direction. It stands back from the bay, half-way between it and the Pacific, among the Coast Range hills. Though built of mud-brick—the sort made by the Israelites in Egypt—and with no pretension to architectural style, it is, in Californian parlance, a *hacienda*; for it is the headquarters of a grazing estate; though not one of the first class, either in stock or appointments. In both respects, it was once better off than now; since now it is less than second, shewing signs of decay everywhere, but nowhere so much as in the house itself, and the inclosures around it. The walls are weather-washed, here and there cracked and crumbling; the doors have seen no paint for years, and opening or shutting, creak upon hinges thickly coated with rust. The *corrals* contain no cattle, nor are there any to be seen upon the pastures outside. In short, the estate shews as if it had an absentee owner, or been abandoned altogether. And the house might appear uninhabited, but for some *peons* seen sauntering listlessly around it, and a barefoot damsel or two, standing dishevelled by its door, or in its kitchen kneeling over the *metate*, and squeezing out the maize-dough for the eternal *tortillas*. However, despite its neglected appearance, it has an owner; and with all their indolence, the lounging *leperos* outside, and slatternly wenches within, have a master. He is not often at home, but when he is, they address him as Don Faustino. Servants rarely add the surname. If these did, they would call him Don Faustino Calderon; for he is the *dueño* of the decayed dwelling. Only at intervals do his domestics see him. He spends nearly all his time elsewhere—most of it in Yerba Buena, now styled San Francisco. And of late more than ever has he absented himself from his ancestral halls; for the *hacienda* is the house in which he was born; it, with the surrounding pasture-land, left him by his father, some time deceased. Since coming into possession, he has neglected his patrimony; indeed, spent the greater portion of it on cards, and debauchery of every kind. The estate is heavily mortgaged, the house has become almost a ruin. In his absence, it looks even more like one; for then his domestics, having nothing to do, are scarce ever seen outside, to give the place an appearance of life. Fond of cards as their master, they may at such times be observed, squatted upon the pavement of the inner court, playing *monté* on a spread blanket, with copper *clacos* staked upon the game. When the *dueño* is at home, things are a little different; for Don Faustino, with all his dissipation, is anything but an indulgent master. Then his domestics have to move about, and wait upon him with assiduity. If they don't, they will hear *carajos* from his lips, and get cuts from his riding-whip.

It is the morning after that night when the *Monté* bank suspended play and pay; the time, six o'clock A.M. Notwithstanding the early hour, the domestics are stirring about the place, as if they had something to do, and were doing it. To one acquainted with their usual habits, the brisk movement will be interpreted as a sure sign that their master is at home. And he is; though he has been there but a very short time—only a

few minutes. Absent for more than a week, he has this morning made his appearance just as the day was breaking. Not alone; but in the company of a gentleman, whom all his servants know to be his intimate friend and associate—Don Francisco de Lara. They have ridden up to the house in haste, dropped the bridles on the necks of their horses, and, without saying a word, left these to the care of a couple of grooms, rudely roused from their slumber. The house-servants, lazily opening the huge door of the *saguan*, see that the *dueño* is in ill-humour, which stirs them into activity. In haste, they prepare the repast called for—*desayuno*.

Having entered, and taken seats, Don Faustino and his guest await the serving of the meal; for a while in silence, each with an elbow rested on the table, a hand supporting his head, the fingers buried in his hair. The silence is at length broken; the host, as it should be, speaking first.

'What had we best do, De Lara? I don't think 'twill be safe staying here. After what's happened, they're sure to come after us.'

'That's probable enough. *Caspita!* I'm puzzled to make out how that fellow who called out our names could have known we were there. "*Crusaders*," he said they were; which means they were sailors belonging to the war-ship, of course the boat's crew that was waiting. But what brought them up; and how came they to arrive there and then, just in the nick of time to spoil our plans? That's the mystery to me.'

'To me too.'

'There were no sailors hanging about the hotel, that I saw; nor did we encounter any as we went through the streets. Besides, if we had, they couldn't have passed us, and then come up from the opposite side, without our seeing them—dark as it was. 'Tis enough to make me believe in second-sight.'

'That seems the only way to explain it.'

'Yes; but it won't, and don't. I've been thinking of another explanation, more conformable to the laws of nature.'

'What?'

'That there's been somebody under that old boat. We stood talking there like four fools, calling out one another's names. Now, suppose one of those sailors was waiting by the boat as we came along, and seeing us, crept under it? He could have heard everything we said; and slipping off, after we retired to the shadow, might have brought up the rest of the accursed crew. The thing seems strange; at the same time it's possible enough, and probable too.'

'It is; and now you speak of it, I remember something. While we were standing under the wall, I fancied I saw a man crouching along the water's edge, as if going away from the boat.'

'You did?'

'I'm almost certain I did. At the time, I thought nothing of it, as we were watching for the other two; and I had no suspicion of any one else being about. Now, I believe there was one.'

'And now, I believe so too. Yes; that accounts for everything. I see it all. That's how the sailor got our names, and knew all about our design—that to do—*murder!* You needn't start at the word, nor turn pale. But you may at the prospect before us. *Carrai!* we're in danger now—

no mistake about it. Calderon, why didn't you tell me at the time you saw that man?'

'Because, as I've said, I had no thought it could be any one connected with them.'

'Well, your thoughtlessness has got us into a fix indeed—the worst ever I've been in, and I can remember a few. No use to think about duelling now, whoever might be challenger. Instead of seconds, they'd meet us with a posse of sheriff's officers. Likely enough they'll be setting them after us before this. Although I feel sure our bullets didn't hit either, it'll be just as bad. The attempt will tell against us all the same. Therefore, it won't do to stay here. So direct your servants not to unsaddle. We'll need to be off, soon as we've swallowed a cup of chocolate.'

A call from Don Faustino brings one of his domestics to the door; then a word or two sends him off with the order for keeping the horses in hand.

'*Chingara!*' fiercely exclaims De Lara, striking the table with his shut fist, 'everything has gone against us.'

'Everything, indeed. Our money lost, our love made light of, our revenge baffled'—

'No, not the last! Have no fear, Faustino. That's still to come.'

'How?'

'How, you ask, do you?'

'I do. I can't see what way we can get it now. You know the English officers will be gone in a day or two. Their ship is to sail soon. Last night there was talk in the town that she might leave at any moment to-morrow, or it may be this very day.'

'Let her go, and them with her. The sooner the better for us. That won't hinder us from the revenge I for one want. On the contrary, 'twill help us. Ha! I shall strike this Crozier in his tenderest part; and you can do the same for Señor Cadwallader.'

'In what way?'

'Faustino Calderon, I won't call you a fool, notwithstanding your behaviour last night. But you ask some very silly questions, and that's one of them. Supposing these *gringos* gone from here, does it follow they'll take everything along with them? Can you think of nothing they must needs leave behind?'

'Their hearts. Is that what you mean?'

'No, it isn't.'

'What, then?'

'Their sweethearts, stupid.'

'But they're going too?'

'So you say, and so it may be. But not before another event takes place—one that may embarrass, and delay, if it do not altogether prevent their departure.'

'*Amigo*, you talk enigmatically. Will you oblige me by speaking plainer?'

'I will; but not till we've had our chocolate, and after it a *copita* of Catalan. I need a little alcohol to get my brain in working order, for there's work for it to do. Enough now to tell you I've had a revelation. A good angel—or it may be a bad one—has visited me, and given it; a vision which shews me at the same time riches and revenge—pointing the straight way to both.'

'Has the vision shewn that I am to be a sharer?'

'It has; and you shall be. But only in proportion as you may prove yourself worthy.'

'I faith! I'll do my best. I have the will, if you'll only instruct me in the way.'

'I'll do that. But I warn you, 'twill need more than will—strength, secrecy, courage, determination.'

'*Desayuno, señores!*' This from one of the domestics announcing the chocolate served.

A few moments suffice for the slight matutinal repast. After which, a decanter of Catalonian brandy and glasses are placed upon the table, with a bundle of Manila cheroots, size number one. While the glasses are being filled, and the cigars lighted, there is silence. Then Calderon calls upon his guest to impart the particulars of that visionary revelation, which promises to give them at the same time riches and revenge.

Taking a sip of the potent spirit, and a puff or two at his cigar, De Lara responds to the call. But first leaning across the table, and looking his confederate straight in the face, he asks, in an odd fashion: 'Are you a bankrupt, Faustino Calderon?'

'You know I am. Why do you put the question?'

'Because I want to be sure, before making known to you the scheme I've hinted at. As I've told you, I'm after no child's play. I ask again, are you a bankrupt?'

'And I answer you, I *am*. But what has that to do with it?'

'A good deal. Never mind. You *are* one? You assure me of it?'

'I do. I'm as poor as yourself, if not poorer, after last night's losses. I'd embarked all my money in the Monté concern.'

'But you have something besides money? This house, and your lands?'

'Mortgaged—months ago—up to the eyes, the ears, the crown of the head. That's where the cash came from to set up the bank that's broken—breaking me along with it.'

'And you've nothing left? No chance for starting it again?'

'Not a *claco*. Here I am apparently in my own house, with servants, such as they are, around me. It's all in appearance. In reality, I'm not the owner. I once was, as my father before me; but can't claim to be any longer. Even while we're sitting here, drinking this Catalan, the mortgagee—that old usurer Martinez—may step in and kick us both out.'

'I'd like him to try. He'd catch a Tartar, if he attempted to kick me out—he or anybody else just now, in my present humour. There's far more reason for us to fear being pulled out by policemen, which makes it risky to remain here talking. So let's to the point at once—back to where we left off. On your oath, Faustino Calderon, you're no longer a man of money?'

'On my oath, Francisco de Lara, I haven't an *onza* left—no, not a *peso*.'

'Enough. Now that I know your financial status, we will understand one another; and without further circumlocution I shall make you a sharer of the bright thought that has flashed across my brain.'

'Let me hear what it is. I'm all impatience.'

'Not so fast, Faustino. As I've already twice told you, it's no child's play; but a business that requires skill and courage. Above all, fidelity among those who may engage in it—for more than two are needed. It will want at least four good

and true men. I know three of them; about the fourth I'm not so certain.'

'Who are the three?'

'Francisco de Lara, Manuel Diaz, and Rafael Rocas.'

'And the fourth, about whom you are dubious?'

'Faustino Calderon.'

'Why do you doubt me, De Lara?'

'Don't call it doubting. I only say I'm not certain about you.'

'But for what reason?'

'Because you may be squeamish, or get scared. Not that there's much real danger. There mayn't be any, if the thing's cleverly managed. But there must be no bungling; and, above all, no backing out—nothing like treason.'

'Can't you trust me so far as to give a hint of your scheme? As to my being squeamish, I think, señor, you do me injustice to suppose such a thing. The experience of the last twenty-four hours has made a serious change in my way of viewing matters of morality. A man who has lost his all, and suddenly sees himself a beggar, isn't disposed to be sensitive. Come, *camarado!* tell me, and try me.'

'I intend doing both, but not just yet. It's an affair that calls for certain formalities, among them some swearing. Those who embark in it must be bound by a solemn oath; and when we all get together, this shall be done. Time enough then for you to know what I'm aiming at. Now, I can only say, that if the scheme succeed, two things are sure, and both concern yourself, Faustino Calderon.'

'What are they? You can trust me with that much, I suppose?'

'Certainly I can, and shall. The first is, that you'll be a richer man than you've ever been since I've had the honour of your acquaintance. The second, that Don Gregorio Montijo will not leave California—at least not quite so soon, nor altogether in the way he is wishing. You may have plenty of time yet, and opportunities, too, to press your suit with the fair Lúez.'

'*Curamba!* Secure me that, and I swear.'

'You needn't set about swearing yet. You can do that when the occasion calls for it. Till then, I'll take your word. With one in love, as you believe yourself, that should be binding as any oath; especially when it promises such a rich reward.'

'You're sure about Diaz and Rocas?'

'Quite so. With them there won't be need for any prolonged conference. When a man sees the chance of getting sixty thousand dollars in a lump sum, he's pretty certain to act promptly, and without being particular as to what that action is.'

'Sixty thousand dollars! That's to be the share of each?'

'That, and more, maybe.'

'It makes one crazy—even to think of such a sum.'

'Don't go crazed till you've got it; then you may.'

'If I do, it won't be with grief.'

'It shouldn't; since it will give you a fresh lease of sweet life, and renew your hopes of having the wife you want. But come! we must get away if we wish to avoid being taken away—though, I fancy, there's nothing to apprehend for some hours yet. The gringos have gone on board their ship,

and are not likely to come ashore again before breakfast. What with their last night's revelry, it'll take them some time to get the cobwebs out of their eyes after waking up. Besides, if they should make it a law matter, there'll be all the business of looking up warrants, and the like. They do these things rather slowly in San Francisco. Then there's the ten miles out here; even if they strike our trail so straight. No; we needn't be in a hurry so far as that goes. But the other's a thing that won't keep, and must be set about at once. Fortunately, the road that takes us to a place of concealment, is the same we have to travel upon business; and that is to the rancho of Rocas. There I've appointed to meet Diaz, who'd have come with us here, but that he preferred staying all night in the town. But he'll be there betimes, and we can all remain with old Rafael, till this ugly wind blows past; which it will in a week, or soon as the English ship sails off. If not, we must keep out of sight a little longer, or leave San Francisco for good.

'I hope we'll not be forced to that. I shouldn't at all like to leave it.'

'Like it or not, you may not have the choice. And what does it signify where a man lives, so long as he's got sixty thousand dollars to live on?'

'True; that ought to make any place pleasant.'

'Well; I tell you you will have it, maybe more. But not if we stand palavering here. *Nos vamos!*'

A call from Calderon summons a servant, who is directed to have the horses brought to the door. These soon appear, under the guidance of two ragged grooms; who, delivering them, see their master mount, and ride off, they know not whither; nor care they, so long as they are themselves left to idleness, with a plentiful supply of black beans, jerked-meat, and *monte*. Soon the two horsemen disappear behind the hills; and the hypotheated house resumes its wonted look of desolation.

### THE STORY OF THE WANDERING JEW.

THERE are probably persons in every country in Europe, although no complete nation or sect, who still believe in the Wandering Jew, the Undying One who wanders century after century over the earth's surface, yearning for death that never comes. Myths live long in the rustic mind after they have been discarded by men of the world and steady thinkers. This is one of them; and, like most of the others, its origin is lost in obscurity, although traceable with much probability to religious feeling, or to a mistaken apprehension of Scriptural passages.

Rich collections of manuscripts have been carefully examined by competent men, to ascertain the most distant date to which these legends or myths can be traced. The oldest document at present known on the subject was written about six hundred and fifty years ago, in the reign of Henry III. The Book of the Chronicle of St Albans' Abbey contains the following narrative, as of a contemporary event. One day the Patriarch or Archbishop of Armenia arrived at the abbey with a small retinue, including an interpreter who could make the Patriarch and the abbot intelligible to each other. He had visited most of the celebrated shrines and holy places in England, and had now come to see the shrine of St Alban. Hospitably entertained for many days, the Patriarch held much

conversation with the abbot and the monks. He was asked, amongst other things, whether he had seen or heard aught of Joseph, a mysterious being who was reputed to have lived ever since the early days of Christianity. The Patriarch replied that he had not only heard of this Undying One, but had been visited by him in Armenia. The story told by the Wanderer was a solemn one. On the day of the Crucifixion, Castaphilus (another name borne by Joseph), a porter in Pontius Pilate's house, struck Jesus on the back with his hand, and bade him mockingly to move on more quickly. A severe but mysterious reproof was administered to him in reply: 'I am going, and you will wait till my return.' Castaphilus lived on century after century, apparently no older than at first. He became a holy and religious man, narrating to bishops and divines events which he had witnessed in the apostolic days. He was always serious, accepted nothing but food and raiment from his entertainers, and looked out anxiously for the Last Day.

Search appears to have been made in vain for any mention of the Wanderer during the fourteenth and fifteenth centuries; but quite early in the sixteenth we hear of a Wandering Jew who assisted a weaver, named Kokot, to discover in Bohemia a treasure which an ancestor of the weaver was reported to have hidden. The Jew is described as appearing like a man seventy years of age.

A few years afterwards the scene shifts, and according to another legend the Stranger makes his appearance in Arabia. When the city of Elvan was captured, Fadhilah and three hundred horsemen pitched their tents in the evening between the mountains. When repeating his prayer to Allah and Mohammed, Fadhilah heard all his words echoed. Demanding who was doing this, Fadhilah saw approaching him a venerable man like a dervish, with staff in hand. The Stranger stated that he came by command of Jesus, who had left him to live upon earth till the second advent. So far the legend; why the apparition appeared to a follower of Islam is not made clear.

About the middle of the same century the Wandering Jew cropped up in Hamburg. Bishop Eitzen narrated that, when a young man, he saw at a church in that city a tall barefoot pilgrim, with hair hanging over his shoulders, standing opposite to the pulpit, listening intently to the sermon, sorrowfully and sighing, and often smiting his breast. A rumour spread that he was the same mysterious person that had recently been seen in England, France, Italy, Hungary, Persia, Spain, Poland, Muscovy, Lapland, Sweden, Denmark, and Scotland. Bishop Eitzen sought him out, and asked him many questions. The Stranger replied that he was a Jew, Abasucrus by name, a shoemaker at Jerusalem; that he had been present at the crucifixion; that he had lived ever since, travelling in various parts of the world. Questioned further, he declared that he had regarded Jesus as a deceiver and heretic, whom he helped to bring to justice; that Jesus, on passing to the place of crucifixion, stood a moment to rest at the shoemaker's door, borne down by the weight of the cross; that the reproof came to him: 'I shall stand and rest, but thou shalt go to the Last Day;' that after witnessing the crucifixion, he was struck with a foreboding that he would never see his

home again, but would wander from country to country as a mournful pilgrim. Returning to Jerusalem many ages afterwards, he found its buildings razed to the ground, inasmuch that he could recognise none of the localities again; and he regarded this as a judgment on him for his misconduct. The bishop, to test him, questioned him concerning historical events which had occurred in Europe during fifteen centuries, and (we are assured) received satisfactory answers. He was abstemious and humble, silent until questioned, and never tarried long in one place. He spoke the languages of all the countries he visited, and—so ends Bishop Eitzen's narrative.

Two papal envoys, sent to Spain about the time of the Spanish Armada, declared on their return that they had seen the Wandering Jew at Madrid, and that he spoke as good Spanish as he had before spoken good German at Hamburg. Another flying rumour located him for a time at Vienna.

France was not likely to be without something to say concerning this inexplicable being. At the beginning of the seventeenth century annalists and chroniclers often made mention of him. We next hear of the Undying One at Naumburg, listening intently to a sermon in church; then a second time at Hamburg; then at Brussels, where we are told to believe as follows. Two citizens, walking in a wood near that city, met an aged man, clad in tattered garments. On invitation, he took a little refreshment with them at an inn, but refused to sit down. He narrated to them many events which he had witnessed centuries before. He was believed by the Brussels people to be the Wandering Jew, but gave himself the name of Isaac Laquedem.

Stories of his appearance in England within the last three centuries are also not uncommon, but are evidently fanciful, or a result of crazy imposture. For example: During or near the reign of Queen Anne, a man made his appearance who claimed to be the Wandering Jew; he was laughed at as an impostor by the educated, but listened to attentively by the ignorant. His story was, that he had been an officer of the Sanhedrim; that he had struck Jesus as he left the judgment hall of Pilate; that he had since travelled all over the world; that he was personally familiar with the habits and customs of the apostles; that he had known the father of Mohammed at Ormuz; that he had rebuked Mohammed for denying the crucifixion; that he had known Nero, Saladin, Tamerlane, Bajazet, and the principal Crusaders; and that he had the power of healing the sick. We are asked to believe that learned collegians at Oxford and Cambridge tried to detect him as an impostor, but failed.

Those who have seen or know anything of Weber's wonderful opera of *Der Freischütz* are aware that its plot depends in part on the German legend of the Wild Huntsman. This legend, it appears, has in some instances been mixed up with the story of the Wandering Jew; inasmuch that it is difficult to say where the one ends and the other begins. In the Harz Mountains—a region well suited for the birth of superhuman or preterhuman myths—the Wild Huntsman is believed by some of the peasantry to be the veritable Wanderer himself, but with a little change of attendant incidents. He is a Jew who, eighteen centuries and more ago, refused to suffer

Jesus to drink out of a river or out of a horse-trough, but contemptuously pointed out to him the hoof-print of a horse, in which a little water had collected, and bade him quench his thirst therewith.

Instead of the Wild Huntsman, other legends and beliefs have come to be mixed up with that of the Wandering Jew. There are parts of France in which the sudden roar of a gale at sea is attributed to the Wanderer passing by there. In some countries he has been regarded as a kind of impersonation of Jews generally. One version of the story associates him with the servant whose ear Peter cut off; while another considers him rather as the impenitent thief. The Gipsies are brought into the *mélée* by one theory, which propounds that the onward-moving Stranger belongs to that community, and that he is doomed to undying life because he refused to shelter the Virgin and Child during the flight from Egypt. In Switzerland, there is a popular story to the effect that the Wandering Jew was one day seen on the Matterberg, a spur or offshoot from the Matterhorn, viewing the scene with sorrow and wonder; that he had once before been there, when it was the site of a flourishing city; and that he will once again be there on the eve of the Last Day.

The biblical record of the period anterior to the Flood, when human life is set down at a duration of eight or nine hundred years, seems to have had something to do with many of the legends relating to the Wandering Jew. True, there are inconsistencies in time, place, person, and circumstances in such legends; but this is no more than may reasonably be expected.

That there are audacious impostors, who have assumed the character of this mysterious being for purposes of their own, is unquestionable. We have noticed one example as having occurred in England in the time of Queen Anne; and Sir Henry Ellis, in his edition of Brand's *Popular Antiquities*, mentions another of much more recent date: 'I remember having seen one of these impostors some years ago in the north of England, who presented a very hermit-like appearance, and went up and down the streets of Newcastle with a long train of boys at his heels, muttering "Poor John alone, alone; poor John alone!" I thought he pronounced his name in a manner singularly plaintive.' Another authority thought the name sounded more like 'Poor Joe alone!' and another, 'Poor Jew alone!'

Need we marvel that the story of the Wandering Jew has been full of attraction for poets and painters? It is just the sort of subject on which the imagination has plenty of material to work upon. An old ballad relating to it is given in Bishop Percy's *Reliques*; the poem of *The Undying One* is built upon it; so is *Salathiel*, and so is Eugène Sue's *Juif Errant*, founded mainly on an old collection of popular French ballads and metrical stories. The Rev. Baring Gould has devoted much attention to the subject, but more with the view of collecting and comparing the various myths and legends than of presenting any of them in a poetical or fanciful form. In our own day, Gustave Doré has presented the world with twelve wonderful designs, in which his exuberant fancy has depicted the Wandering Jew in many supposed incidents of his undying career. There is the shoemaker at his shop-door, gazing at

the solemn procession to the place of crucifixion, after the awful words had been uttered to him: There is the wild scene in which he is walking on during a raging storm, and startled at seeing a crucifix by the wayside. There is the town scene, with men and boys assembling to see the Wanderer pass by. There is the scene outside an alehouse, with burghers mockingly asking him to drink. There is the dismal scene of the barefoot pilgrim wading through marsh and slough, his tattered garments blown about by the wind. There is the churchyard, with the clouds mysteriously made up of beings celestial and terrestrial, to typify the thoughts occupying his mind at that moment. There is the mountain scene, with trees similarly presenting half-human outlines; and another wherein angels and Calvary are seen among the clouds. There is the terrible battle-field, in which slaughter is going on all around him; while he, the Undying One, cannot give up life even if he would; and the shipwreck, in which all are lost but he. There is the valley full of snakes and hideous reptiles, none of which can put an end to his lonely existence. Lastly, there is the Day of Judgment, in which Doré's rich imagination has full scope.

## REPORTERS' MISTAKES.

REPORTERS for the press, like other human beings, are liable to make mistakes; and when one considers the difficulties with which they have to contend, we wonder that their blunders are not much more frequent. The reporter, however, it is but just to say, is not always entirely at fault, seeing that he receives occasional assistance from the printer; and when both trip, the result is at times very funny.

As is generally known, reporters are particularly liable to blundering when a speaker indulges in quotation. When Mr Lowe quoted a stanza from Coleridge's *Ancient Mariner* in one of his speeches, not one of the London morning papers gave the lines correctly. Preaching before the British Association, the Archbishop of York borrowed something from Tennyson, and although, in reporting his sermon, the *Times* contrived to leave the poetry unmarred, it set down His Grace as leading up to the quotation with, 'There is nothing ascertainable in what you call spiritual things; the Post Office Telegraphs, which best interprets this age, tells you the best you can come to in that line of thought.' Next morning, it was good enough to explain that 'the Post Office Telegraphs' should be read 'the Poet Laureate.'

Another reverend orator winding up an address with,

Only the actions of the just  
Smell sweet and blossom in the dust,

was rather surprised at seeing Shirley's tolerably familiar couplet transmogrified into,

All the low actions of the just  
Swell out and blow Sam in the dust.

Equally astonished, we daresay, was Professor Huxley at finding himself fathering upon Locke the extraordinary political doctrine that the end of government was the good of the government; but his indignation was hardly likely to be so great

as that of a peace-at-any-price advocate when he discovered that a cruel northern journalist, by merely introducing one unnecessary letter, turned what was intended to be sublime into something deliciously ridiculous, and made his vigorous peroration end: 'Let us, then, unanimously, earnestly, resolutely, take our place in that increasing host,

Along whose front no sabres shine,  
No blood-red pennons wave,  
Whose banners bear the simple line—  
'Our duty is to shave!'

In justice to the fraternity, it must be conceded that reporters are often saddled with other folk's sins. It must have been the compositor's fault that the preacher's 'Men should work and play too,' was changed into 'Men should work and play Loo,' and that the death of the subject of a coroner's inquest was attributed to 'serious apoplexy.'

But for the worthy compositor's ingenious misreading of his copy, the public would never have known that 'a number of small sextons' had been sent out with the Ashantee Expedition; that the Pittsburg legislature had 'pasted' a certain bill over the governor's head; that a gentleman connected with the Brighton Aquarium had undertaken the charge of 'a marine and fresh-tater aquarium in New York;' and that one evening the House of Commons ordered the chairman 'to repeat prayers,' instead of reporting progress. Nor was it anybody else's fault that our great-grandfathers were scandalised at learning that at the Old Bailey Sessions in 1799, 'the grand jury, after a suitable exhortation from Lord Kenyon, were ordered to be privately whipped and discharged.' We have read, however, of more impossible things coming to pass than the whipping of grand jurors. Not long ago, a tailor stood in the dock for misappropriating his employer's property, and the latter, we were told, deposed that 'the materials were to be returned made up on a Thursday, and on the Sunday following, he discovered that the deceased had left his home, and he did not see him again until he was in custody.' The 'deceased' was sentenced to a month's hard labour. The following is a curious sample of printers' mixture which the *Daily Telegraph* once set before its readers. This purported to be a report of a case in the Bankruptcy Court, and after stating that the registrar ordered a receiver to be appointed, but declined to restrain the action of the creditors, went on thus: 'A good deal of evidence was given, and in the course of the case his lordship expressed an opinion that a juror should be withdrawn, and that the case was one for only a farthing damages. It was, the judge said, a sad thing to see a young man in such a position, which there was no doubt had been brought about by habits of intemperance, and but for the recommendation of the jury, he should have passed a very severe sentence. He advised him to abstain from drink for the future, and sentenced him to be imprisoned and kept to hard labour for six months.'

Some of the industrious gentlemen whose avocation it is to hunt up news for provincial journals, have a very odd way of putting things. Under the heading, 'Death from Drowning,' we read: 'On Saturday, Mr J. C. Jarrold, deputy-coroner, held an inquest at the *Hazard Arms*, Mill Lane, concerning the death of Thomas Shipp, who was drowned on the following night.' Chronicling the coming to

grief of a young trapeze performer, the reporter says: 'It was afterwards discovered that the boy's collar-bone was broken, but, unfortunately, his injuries are not of a dangerous description.' Another announces, without a word of protest against the vivisectionists, that 'A British Workman is about to be opened at Morpeth.' A third tells us: 'A pony-carriage was passing along New Bond Street, Bath, when, in turning into Northgate Street, it fell down and broke both of its legs.' Recording some steeple-chase doings at Monaghan, the *Irish Times* said: 'A very nice day's sport was carried on over an excellent course, all grass, over the lands of Mr Henderson, whose hospitality was unbounded. It consisted of two walls, two bank drops, a water cut, and two hurdles.' Telling of a man who lost his life in a riot, a Belfast paper ended the story with: 'They fired two shots at him; the first shot killed him, but the second was not fatal.' He was not blessed with a couple of lives, like the deaf man, named Taff, who 'was run down by a passenger train and killed; he was injured in a similar way a year ago.' The Irish journalists, however, cannot be accused of monopolising the manufacture of bulls; their English brethren are equally clever that way; as they proved by sending the Princess Louise to Wimbledon 'to witness the shooting of her husband'; describing the Prince of Wales's second son as 'an amiable boy like his mother'; and announcing that the Duke of Hamilton would shortly take to wife 'the late Lady Mary Louisa Elizabeth Montague.'

An American editor receiving a telegram from London, running, 'Oxford Music Hall burned to the ground,' jumping too hastily to conclusions, hastened to publish the melancholy news that the principal music-hall of academic Oxford had been utterly destroyed by fire; and not content with a simple announcement of the disaster, informed his readers that the burned hall was situated in the midst of the historic colleges of Oxford, which had miraculously escaped destruction from the flames, which, fanned into a fury by a favourable wind, lit up the academic spires and groves as they ran along the rich cornices, lapped the gorgeous pillars, shrivelled up the roof, and grasped the mighty walls of the ancient building in their destructive embraces, filling townsmen and gownsmen with terror and consternation, until driven back by an unfavourable wind, the flames gradually succumbed to the superhuman efforts of the firemen, and the great seat of learning was saved from the fate of Boston.

Equally imaginative was the account given by a fashionable London newspaper of the enthronement of the present Bishop of Lincoln; and considering that town journalists are never chary of making fun out of the mistakes of the country press, it was not surprising that the *Lincolnshire Chronicle* should make the most of the opportunity for retaliation, which it did in this thorough fashion: 'The *Pall Mall Gazette* of Tuesday last contains a description of the enthronement of the Bishop of Lincoln in the cathedral on that day. We congratulate our contemporary on the great inventive genius displayed by its correspondent. We notice, indeed, in the list of clergy present, the names of only two who were not there at all; but the careful attention to detail, evidenced by the unusual accuracy with which initials and proper names are given, renders the general char-

acter of the paragraph still more striking. The announcements that the mayor and corporation, of whom none, we believe, were present, "attended in state;" that "appropriate anthems" were sung in procession, when there was nothing of the kind; that the bishop knelt at the rails, which he didn't; that the service-music was Croft's *Te Deum* and Jubilate in A, when, in fact, it was Wickes's *Benedicite*, and Young's *Jubilate* in G; that the anthem was, "We praise Thee, O God—Parcell," of which, probably, no one but the *Pall Mall* reporter ever before heard; that Handel's *Hallelujah Chorus* was given at the conclusion of the service, which it wasn't; that "the procession then re-formed," which it certainly did not in any sense; "and having moved to the Chapter House," which, probably, no one entered all day, "where the dean, canons, and treasurer"—an officer who does not exist—"made the usual promise of canonical obedience," which they did not do, for the simple reason that they have no such promise to make: all suggest somewhat uncomfortable reflections on the value of contemporary history.' The offending *Pall Mall Gazette* reporter would have escaped such a setting-down if he had been actuated by a non-committal policy, like the French paragraphist who wrote: 'The Princess de Metternich is to retire from society for a little while, and is buying edgings, insertions, muslins, and so on, which she is making up into little garments, too large for a doll, and too small for herself; or the American lady-journalist who penned the suggestive 'item: 'On Monday, April the tenth, five hundred barrels of Cincinnati whisky were landed on the levee at Louisville. On Wednesday the twelfth, the *Louisville Courier Journal* appeared without a line of editorial.' As it was, the erring writer must, like the Wisconsin minister, be adjudged guilty of 'not always handling the truth with sufficient carefulness to meet the demands of veracity.'

#### IN THE LANE.

THE daisies star the summer grass;  
And, with the dancing leaves at play,  
Adown this lane the breezes pass,  
In pleasant music, all the day.

I love the sweet, sequestered place,  
The gracious roof of gold and green,  
Where arching branches interlace,  
With glimpses of the sky between.

I see the drooping roses trail  
From tangled hedgerows to the ground;  
I hear the chanting swell and fall,  
Of fond love-lyrics, all around.

And here, adown the shady walk,  
In days divine now passed away,  
Entranced, I listened to the talk,  
That ever held my heart in sway.

In days when birds began to sing,  
Because they found the earth was fair;  
In halcyon days of happy spring,  
None aught but us our joys to share.

But pleasure past is present pain;  
The petals of the rose are shed;  
The piercing thorns alone remain;  
I live to sorrow for the dead.

## KENT'S CAVERN.

ON the western side of the beautiful Vale of Ilsham, about a mile eastward from the harbour of Torquay, in Devonshire, and half a mile from the northern shore of Torbay, stands a small, wooded, limestone hill, containing a large cavern, which, under the name of Kent's Hole or Cavern, has been known from time immemorial, and during nearly half a century has attracted the attention of geologists and archaeologists. The derivation of its name is unknown; the natives solve the problem easily by saying the cave has an outlet in Kent. Though known from times the most remote, the earliest date which we found cut on its red rock walls is 1648, with the letters R. F.; but it has been reserved for science in this century to expound its wonders, and they are being enlarged, we may add, day by day, for excavations are yet being made in it under the superintendence of that veteran geologist, Mr Pengelly.

A recent visit enables us to describe what it has done for palæontology, and what it is still doing. Let the reader in fancy make his way to a rough hill-side covered with thickets of blue-bells in spring, and virgin's bower in autumn, and overshadowed by oaks—just such another 'combe,' in short, as runs towards the sea at many other parts of South Devon. There some seventy feet above the bottom of this valley, and a hundred and eighty or ninety feet above the level of mean tide, by a red muddy track he can mount to a couple of doors inserted in the Devonian limestone of which the hill is formed. They are rude planken entrances, much like what we traditionally fancy was the door leading to Aladdin's cavern, and they contain what to an unscientific eye seem but as valuable as old lamps, though when touched by science these remains turn into archaeological treasures, and bear a wonderful history. At the door is a confused heap of limestone and red earth, while a track laid with planks, on which the excavator can run his wheelbarrow, speedily disappears in the inner darkness. Probably the man himself, smeared all over with red clay, like a North American

Indian, blocks up the entrance, while he carefully searches all the earth he has just brought out, and deposits in tins, for the exploration committee, such bones, teeth, &c. as he may discover, preliminary to tipping the barrow-load of rubbish into the valley, and returning for a fresh quantity. The two entrances, he tells us, run in some six hundred feet, the one at which he now works being five hundred feet in length; and a low passage heaped up with earth, which has not yet been explored, runs much farther. In fact, the extent of the cave is unknown; but the two passages open into chambers, of which the largest one on the eastern side is sixty-two feet from east to west, and fifty-three feet from north to south. Having finished this preliminary description, let us now enter.

The workman shouts in a very gruff tone into the darkness for his 'mate.' This, after some time, brings out his fellow-workman, equally red and gruff with himself. Their whole appearance and manners are somewhat bearish, as becomes the natives of so renowned a bear's den. The method of lighting the visitor through the gloomy recesses of this old-world cave is somewhat primitive. A tallow candle, fastened into a stick with a hole in it, is handed to each person; the guide then leads the way, and the exploration begins. Every here and there are pools of water, or abrupt descents into dark abysses, so that prudence whispers a careful keeping of the muddy track. The attendant points out old as well as new *floors*, which at first perplex the visitor, until he has been made aware, as we shall presently do, of the extent of the excavations that have been going on for years past. Then he holds up his candle to the roof, and there *in situ* may be seen a hyena's tooth, a skull, and two leg-bones. The guide is naturally very careful lest the visitor should appropriate curious relics, and properly so, for at a recent visit of the British Association, in spite of a person who was posted to prevent it, some unscrupulous *savant* managed to evade him, and to extract and carry away such another tooth, much to Mr Pengelly's vexation. Next we reach the 'workings,' where a few bones in good preservation are taken up, as we

watch, from the clammy red earth. Then there is more peering about and holding up of candles into dark corners; one lady slips into a slough of mud and water; while another, a bride, beats a hasty retreat, lest she should share the same fate. The guides are bantered by some one about the few attractions of the cave, and it is suggested that two or three savage dogs should be tied up at the end of it, to howl when strangers entered, and so produce a more lively image of what its prehistoric appearance was when bears and hyenas growled over the bones of their prey.

The first impulse of the thoughtful visitor is to sit down and endeavour to reproduce the curious prehistoric life of beasts and men to the vestibule of which he has just been introduced. In the presence of the wealth and civilisation of Torquay, with its splendid villas, its harbour crowded with yachts, and the little 'midges' conveying pleasure-parties into all the leafy 'combes' which surround the town, this is not at first easy. Let us endeavour to help the puzzled visitor to a better understanding than that furnished by his guides of the mysteries of Kent's Cavern, and explain why the various 'floors' he observed during his threadings came to be there. And to our aid we shall call Mr Boyd Dawkins, whose book on *Cave-hunting* is an exhaustive account of the phenomena, and deductions therefrom, of every European cave that civilised man has yet explored.

Let us try, then, to gain a mental image of the cavern, and the way in which it has been formed. The valley in front of it is supposed to have been gradually deepened with the erosive action of water. It may even be that the sea originally commenced the excavation of the cave; while the force of streams that once flowed through it, and the percolation of rain-water from above, enlarged its cavity. The base of the cave is occupied with dark-coloured earth, fragments and blocks of limestone and of stalagmite, bones of extinct animals, and flint weapons of human workmanship. Below this is a compact dark-red breccia. Above the red earth, again, was a stalagmitic floor, varying in thickness from a few inches to three feet, on which was dark earth, when the investigations commenced, mingled with large blocks of limestone which had fallen from the roof. This contained medieval remains, Roman pottery, combs fashioned of bone, bronze articles, and polished stone celts, and charcoal. These, however, do not exhaust the successive layers which are here of interest. Some way under the solid stone roof, and now higher than the heads of visitors, is an ancient stalagmitic floor, which shuts off the open space under the vaulted solid stone. This contains the key of the apparent confusion of layers. At the time when it was formed by the dripping of the upper rock, the cave must have been filled to its level with debris, fragments of which (as we have seen in the case of the tooth and leg-bones) are set in the inferior portion of the calcareous sheet. Before the lower stalagmitic floor, with its surface of dark earth and antiquities, and its underlying red cave-earth, was introduced, the whole of this debris has been swept out, probably by a flood or other convulsion of nature. Then the formation of its present contents, as we have described them, took place, which accounts for there being two distinct stalagmitic floors—the Modern and the Old.

There are several caverns in the district resembling Kent's Cavern both in contents and formation; notably one at Brixham, of six hundred feet in length, where its owner shews flint implements, and some thousands of bones, teeth, &c. of extinct bears, deer, horses, and cave-lions. With regard to the growth of the stalagmitic floor, the visitor can see the drip of the water on it from above, and the guide will tell him it increases at the rate of one-tenth of an inch in one thousand years. But these calculations are not strictly correct. Disturbing causes are at work, and the rate of deposition is not uniform; in any case, however, the accretion of a solid stalagmitic flooring is the effect of a great lapse of time.

The contents of Kent's Cavern may now be described. They may be divided into the remains of historic man, of prehistoric man, and of the extinct animals. The first were found on the dark earth, mixed with blocks of limestone which had fallen from the roof. They consisted of Roman pottery, and combs fashioned out of bone, similar to those found in Yorkshire and elsewhere, and proved that the cave had been frequented during historic times. A barbed iron spear-head, a bronze spear-head, and other articles of the same material, together with polished stone celts, shew that the cave was inhabited during what are known as the iron, bronze, and neolithic or later stone ages. This earthy deposit also contained large quantities of charcoal, and bones of the goat, horse, and short-horn (*Bos longifrons*). Below this, a stalagmitic floor covered the red cave-earth. This held stones, bones of extinct animals, and flint implements. These consisted chiefly of the well-known flint flakes. Three harpoon-heads, an awl, and a needle of bone, were also discovered. This red cave-earth itself rested on a dark red compact breccia, which held bones of bears, and also four flint implements. These shew the co-existence of palæolithic man and the great quadrupeds.

Many of these bones, teeth, &c. may be seen in different museums. The Albert Museum, Exeter, contains a good series of them; and many admirable specimens may also be found in the York Museum. In it may be seen the large double-edged canines of the *Machairodus latidens*, a huge lion-like animal with teeth resembling the blade of a sabre, which have never before or since been procured in any other British cavern. Similar remains have, however, been found in two localities in France. Hyenas' teeth, and bears' bones which have unmistakably been gnawed by hyenas, are amongst the curiosities of the cave, and are to be found in many geological museums. To give in detail a list of the animals whose remains have been detected in Kent's Cavern would be interesting only to the palæontologist, and he can readily find it in the already voluminous literature of the cavern. We shall merely name the most interesting animals whose bones have been found in Kent's Cavern, in order to give some idea of the varied life which has found shelter in its dark precincts. Palæolithic man (as he is called), with his flint weapons and stone implements; the beaver, hare, cave-lion, wild cat, hyena; brown, grizzly, and cave bears; mammoth, urus, woolly rhinoceros, Irish elk, and reindeer. These probably inhabited Britain, France, and Germany during the pleistocene period, and were contemporaries of man. Then succeeded neolithic

man with his bronze and polished stone weapons, and the extinction of the large mammals. The Roman with his pottery was followed by the Dane or Northman with his comb, and so the centuries passed on, till, in the nineteenth, science wakes the buried life of long-past ages, and the dry bones once more live.

A chronological statement of the explorations of the cave may not be unacceptable. Though known, as we have stated, from time immemorial, it was first found to contain fossil bones by Mr Northmore and Sir C. Trevelyan in 1824. Mr M'Enery explored it in a superficial way for the next three years. The workmen are at present engaged in sifting what he had cursorily turned over, and know it as the 'intermediate earth.' He was the first to discover the remains of the *Machairodus*, which probably lived here at an early stage of the pleistocene era. Flint implements were found by Mr Austen in 1840, and again six years later by a committee of the Torquay Natural History Society. Then Mr Pengelly, whose name is so honourably associated with the cavern, took up the work, and in 1864 a committee was appointed, under his direction, by the British Association, which still, as we have seen, prosecutes its inquiries. Thus a great mass of evidence is being slowly accumulated; and just as a veteran palaeontologist picks out a bone or a flint weapon from the debris of the cave, and by its aid builds up a theory, or announces a fact which dethrones many a time-honoured belief; so in days to come, the far-seeing philosopher will scan these records, and once more, it may be hoped, cause the whole ancient pleistocene world, its uncouth uncivilised men, and its grotesque and savage monsters, to live and move, as it were, before their eyes. Perhaps another fact should be mentioned under the name of Rev. J. M'Enery: he was the first to discover flint weapons mixed with fossil bones in England, and the discovery occurred in Kent's Cavern.

Ordinary readers will be puzzled at finding in the list of animals above given, some which are natives of a torrid zone, others of a glacial region; and also to notice that many of them have long been extinct, even before historic ages, in our islands. It may help him to attain sounder ideas on these two points, if he remembers that modern science has established the probability of Great Britain having once been joined to the mainland of Europe, and of its having undergone considerable climatic change. Even in historic times, our climate has greatly changed. Sir F. Palgrave deems that at the Norman Conquest it resembled the climate of Canada in its extremes of heat and cold. Vineyards then flourished in Somersetshire, and even in the neighbourhood of London. But much farther back—indeed, Mr Geikie says, speaking as a geologist, 'upwards of two hundred thousand years ago'—a series of astronomical movements resulted in our hemisphere possessing a most intensely severe glacial climate. A large tract of Europe was then submerged, it is supposed, and once more elevated while the climate was gradually ameliorated. These variations would allow animals of both hot and cold countries successively to occupy and withdraw from Great Britain. Another change in the appearance of the United Kingdom may be accounted for by its being joined to the continent. A multitude of facts can only be explained satisfac-

torily on this hypothesis. Thus the land has been lowered to form the present configuration of North-west Europe and our isles. In order to realise this effect, it is only necessary to remember that soundings prove that Great Britain and Ireland constitute an upland plateau submerged to the extent of about one hundred fathoms on the side of the Atlantic. Towards Belgium a sea of from fifty to twenty fathoms separates us from the mainland, while the English Channel is only sunk between forty and twenty fathoms below the sea-level. Were all this tract suddenly elevated one hundred fathoms, a tract of land would encompass Great Britain and Ireland, uniting us to Belgium and the north of France, while the Thames would join with the Elbe and Rhine to form a great river flowing into the North Sea, much above the present north of Scotland; and our western rivers, the Seine and the Somme, would enter the Atlantic some way from the western shores of what is now Ireland. During the pleistocene period, this is supposed to have been the configuration of North-western Europe; and if this were so, it at once renders plain how the great mammalia and other creatures whose fossil bones are now found in Kent's and other caverns, could have passed into England from the continent.

Since the above was penned, we learn from the *Correspondance Scandinave*, that Dr Reusch, a gentleman attached to the Geological Survey of Norway, has been examining, at Sandmore, caverns somewhat similar to those in Devonshire; and that he found in the Slong cavern numerous interesting relics of its ancient inhabitants. The upper bed of the cave he found to be composed mainly of the remains of sheep and goats, which no doubt have for many ages used it as a place of shelter from the weather. Below, there is a deposit of ashes, mussel-shells, and the bones of different species of animals. Among these were found a large number of ancient relics, principally arrow-heads and broken glass. In the event of similar discoveries, adds the *Correspondance*, being made in the other caverns of the country, an unexpected light will be thrown upon the former inhabitants of Norway as they existed at an epoch anterior to the times treated of even in the most ancient histories.

## THE FLAG OF DISTRESS.

### CHAPTER XXVII.—A CONVERSATION WITH ORANGE.

NOTWITHSTANDING his comfortable quarters in the frigate, Harry Blew is up by early daybreak, and off from the ship before six bells have sounded. Ere retiring to rest, he had communicated to his patron, Crozier, a full account of his zigzag wanderings through the streets of San Francisco, and how he came to bring the boat's crew to the rescue. As the two officers are not on the early morning watch, but still abed, he does not await their rising; for, knowing that the adage, 'First come, first served,' is often true, he is anxious as soon as possible to present himself at the office of the agent Silvestre, and from him get directions for going on board the *Condor*. He is alive to the hint given him by Crozier, that there may be a chance of his being made mate of the Chilean ship. As yet he does not even know the name of the vessel, but that he will learn at the office,

as also where she is lying. His request to the lieutenant on duty for a boat to set him ashore, is at once and willingly granted. No officer on that frigate would refuse Harry Blew; and the dingy is placed at his service. In this he is conveyed to the wooden pier, whose planks he treads with heavier step, but lighter heart, than when, on the night before, he ran along them in quest of assistance. With heavier purse too, as he carries a hundred pound Bank of England note in the pocket of his pea-jacket—a parting gift from the generous Crozier—besides a number of gold pieces received from Cadwallader, as the young Welshman's share of gratitude for the service done them. Thus amply provided, he might proceed at once to the 'Sailor's Home,' and bring away his embargoed property. He does not. Better first to see about the berth on the Chilian ship; and therefore he steers direct for the agent's office.

Though it is still early, by good luck, Don Tomas chances to be already at his desk. Harry presents the card given him by Crozier, at the same time declaring the purpose for which he has presented himself. In return he receives from Silvestre instructions to report himself on board the Chilian ship, *El Condor*; Don Tomas, furnishing him with a note of introduction to her captain, points out the vessel, which is visible from his door, and at no great distance off.

'Captain Lantanas is coming ashore,' adds the agent; 'I expect him in the course of an hour. By waiting here, you can see him, and it will save your boat-hire.'

But Harry Blew will not wait. He remembers the old saying about procrastination, and is determined there shall be no mishap through negligence on his part, or niggardliness about a boat-fare. He has made up his mind to be the *Condor's* first-mate—if he can. Nor is it altogether ambition that prompts him to seek the office so earnestly. A nobler sentiment inspires him—the knowledge that in this capacity he may be of more service, and better capable of affording protection, to the fair creatures whom Crozier has committed to his charge.

The watermen of San Francisco harbour do not ply their oars gratuitously. Even the shabbiest of shore-boats, hired for the shortest time, demands a stiffish fare. It will cost Harry Blew a couple of dollars to be set aboard the *Condor*, though she is lying scarce three cables' length from the shore! What cares he for that? It is nothing now. Hailing the nearest skiff with a waterman in it, he points to the Chilian ship, saying: 'Heave along, lad! an' put me aboard o' yonder craft—that one as shews the tricolor bit o' buntin' wi' a single star in the blue. The sooner ye do your job, the better ye'll get paid for it.'

A contract on such conditions is usually entered into with alacrity, and with celerity carried out. The boatman beaches his tiny craft, takes in his fare, and in less than ten minutes' time, Harry Blew swarms up the man-ropes of the Chilian ship, strides over the rail, and drops down upon her deck. He looks around, but sees no one—at least nothing in the shape of a sailor. Only an old negro, with a skin black as a boot, and crow-footed all over the face, standing beside two singular creatures nearly as human-like as himself, but covered with fox-coloured hair—the pets of

Captain Lantanas. The old man-o'-war's-man is for a time in doubt as to which of the three he should address himself. In point of intelligence there seems not much to choose. However, he with the black skin cuts short his hesitation by coming up, and saying: 'Well, mass'r sailor-man, wha' you come for? S'pose you want see de capten. I 'se only de cook.'

'Oh, you're only the cook, are you? Well, old caboose; you've made a correct guess about my bizness. It's the capten I want to see.'

'All right. He down in de cabin. You wait hya, I fetch 'im up less'n no time!'

The old darkey shuffling aft, disappears down the companion-way, leaving Harry with the two monstrous-looking creatures, whom he has now made out to be orang-outangs.

'Well, mates!' says the sailor, addressing them in a jocular way, 'what be your openyun o' things in general? D'ye think the wind's goin' to stay sou'-westerly, or shift roun' to the nor'-eastart?'

'Cro—cro—croak!'

'Oh, hang it, no. I ain't o' the croakin' sort. Ha'n't ye got nothin' more sensible than that to say to me?'

'Kurra—kra—kra. Cro—cro—croak!'

'No; I won't do anythink o' the kind; leas'tways, unless there turns out to be short commons in the ship. Then I'll croak, an' no mistake. But I say, old boys, how 'bout the grog? Reg'lar allowance, I hope—three tots a day?'

'Na—na—na—na—na—boof! Ta—ta—ta—fuff!'

'No! only two, ye say! Ah! that won't do for me. For ye see, shipmates—I s'pose I shall be callin' ye so—'board the old *Crusader*, I've been 'customed to have my rum reg'lar, three times the day; an' if it ain't same on this here craft, in the which I'm 'bout to ship, then, shiver my spars! if I don't raise sich a rumpus as'—

'Kurra—kurra—cr—cro—croak! Na—na—na—boof—ta—ta—pf—pf—piff!'

The sailor's voice is drowned by the gibbering of the orangs, his gesture of mock-menace, with the semi-serious look that accompanied it, having part frightened, part enraged them. The fracas continues, until the darkey returns on deck, followed by the skipper; when the cook takes charge of the *quadrumana*, drawing them off to his caboose.

Captain Lantanas, addressing himself to the sailor, asks: '*Un marinero?*' (A seaman?)

'*Sí, capitan.*' (Yes, captain.)

'*Que negocio tienes V. coningo?*' (What is your business with me?)

'Well, capten,' responds Harry Blew, speaking the language of the Chilian, in a tolerably intelligible *patois*, 'I've come to offer my services to you. I've brought this bit of paper from Master Silvestre; it will explain things better than I can.'

The captain takes the note handed to him, and breaks open the envelope. A smile irradiates his sallow face as he becomes acquainted with its contents.

'At last a sailor!' he mutters to himself; for Harry is the only one who has yet offered. 'And a good one too,' thinks Captain Lantanas, bending his eyes on the ex-man-o'-war's-man, and scanning him from head to foot. But, besides personal inspection, he has other assurance of the good qualities of the man before him; at a late

hour on the night before, he held communication with Don Gregorio, who has recommended him. The haciendado had reported what Crozier said—that Harry Blew was an able seaman, thoroughly trustworthy, and competent to take charge of a ship, either as first or second officer. With Crozier's endorsement thus vicariously conveyed, the ex-man-o'-war's-man has no need to say a word for himself. Nor does Captain Lantanas call for it. He only puts some professional questions, less inquisitorially than as a matter of form. He speaks now in English.

'The Señor Silvestre advises me that you wish to serve in my ship. Can you take a lunar?'

'Well, capten, I hev squinted through a quadrant afore now, an' can take a sight; tho' I ain't much up to loonnars. But, if there's a good chronometer aboard, I won't let a ship run very far out o' her reck'nin.'

'You can keep a log-book, I suppose?'

'I dar say I can. I've larned to writo so 'st might be read, tho' my fist an't much to be bragged about.'

'That will do,' rejoins the skipper, contentedly. 'Now, Señor Enrique I see that's your name—answer me in all candour. Do you think you are capable of acting as *piloto*?'

'By that you mean mate, I take it?'

'Yes; it is *piloto* in Spanish.'

'Well, capten, 'tain't for me to talk big o' myself. But I've been over thirty year 'board a British man-o'-war—more'n one o' 'em—an' if I wan't able to go mate in a merchanter, I ought to be condemned to be cook's scullion for the rest o' my days. If your honour thinks me worthy o' bein' made first-officer o' the *Condor*, I'll answer for it she won't stray far out o' her course, while my watch is on.'

'Enough, Señor Enrique—B—blee. What is it?' asks the Chilian, re-opening the note, and vainly endeavouring to pronounce the Saxon surname.

'Blew, Harry Blew.'

'Ah, Bloo—*azul*, *esta*?'

'No, capten. Not that sort o' blue. In Spanish, my name has a diff'rent significance. It means, as we say of a gale after it's blowed past—it "blew." When it's been a big un, we say it "blew great guns." Now ye understand?'

'Yes; perfectly. Well, Señor Blew, to come to an understanding about the other matter. I'm willing to take you as my first-officer, if you don't object to the wages I intend offering you—fifty dollars a month, and everything found.'

'I'm agreeable to the terms.'

'*Basta!* When will it be convenient for you to enter on your duties?'

'For that matter, this minute. I only need to go ashore to get my kit. When that's stowed, I'll be ready to tackle to work.'

'*Bueno*, señor; you can take my boat for it. And if you see any sailors who want to join, I authorise you to engage them at double the usual wages. I want to get away, as soon as a crew can be shipped. But when you come back, we'll talk more about it. Call at Señor Silvestre's office, and tell him he needn't look for me till a later hour. Say I've some business that detains me aboard the ship. *Hasta Luego!*'

Thus courteously concluding, the Chilian skipper returns to his cabin, leaving the newly appointed *piloto* free for his own affairs.

## CHAPTER XXVIII.—THE 'BLUE-PETER.'

The ex-man-o'-war's-man, now first-mate of a merchant-ship, and provided with a boat of his own, orders off the skiff he has kept in waiting, after tossing into it two dollars—the demanded fare—then slipping down into the *Condor's* gig, sculls himself ashore. Leaving his boat at the pier, he first goes to the office of the ship-agent, and delivers the message intrusted to him. Then contracting with a truckman, he proceeds to the 'Sailor's Home,' 'relieves' his *impedimenta*, and starts back to embark them in his boat; but not before giving the bar-keeper, as also the Boniface, of that inhospitable establishment a bit of his mind. Spreading before their eyes the crisp hundred-pound note, which as yet he has not needed to break, he says tauntingly: 'Take a squint at that, ye land-lubbers! There's British money for ye. An' tho' 't be but a bit o' paper, worth more than your gold-dross, dollar for dollar. How'd ye like to lay your ugly claws on 't? Ah! you're a pair of the most gentlemanly shore-sharks I've met in all my cruizes, but—ye'll never have Harry Blew in your grups again.' Saying this, he thrusts the bank-note into his pocket; then paying them a last reverence with mock-politeness, he starts after the truckman, already *en route* with his kit.

In accordance with the wishes of Captain Lantanas, he stays a little longer in the town, trying to pick up sailors. There are plenty of these sauntering along the streets and lounging at the doors of drinking-saloons. But even double wages will not tempt them to abandon their free-and-easy life; and the *Condor's* first-officer is forced to the conclusion, he must return to the ship *solus*. Assisted by the truckman, he gets his traps into the gig; and is about to step in himself, when his eye chances to turn upon the *Crusader*. There he sees something to surprise him; the 'Blue-Peter!' The frigate has out signals for sailing! He wonders at this; there was no word of it when he was aboard. He knew, as all the others, that she was to sail soon—it might be in a day or two. But not as the signal indicates, *within the hour or two*. While conjecturing the cause of such hasty departure, he sees something that partly explains it. Three or four cables' length from the *Crusader* is another ship, over whose taffrail floats the flag of England. At a glance, the old man-o'-war's-man can tell she is a corvette; at the same time recalling what, the night before, he has heard upon the frigate: that the coming of the corvette will be the signal for the *Crusader* to sail. While his heart warms to the flag thus doubly displayed in the harbour of San Francisco, it is a little saddened to see the other signal—the 'Blue-Peter'; for it tells him he may not have an opportunity to take a more formal leave of his friends on the frigate, which he designed doing. He longs to make known to Mr Crozier the result of his application to the captain of the Chilian ship, to receive the congratulations of the young officers on his success; but now it may be impossible to communicate with them, the *Crusader* so soon leaving port. He has half a mind to put off for the frigate in the *Condor's* gig, into which he has got. But Captain Lantanas might, meanwhile, be wanting both him and the boat.

All at once, in the midst of his irresolution, he sees that which promises to help him out of the dilemma—a small boat putting off from the frigate's sides, and heading right for the pier. As it draws nearer, he can tell it to be the dingy. There are three men in it—two rowers and a steersman. As it approaches the pier-head, Harry recognises the one in the stern-sheets, whose bright, ruddy face is towards him. 'Thank the Lord for such good-luck!' he mutters. 'It's Mr Cadwallader!'

By this the dingy has drawn near enough for the midshipman to see and identify him; which he does, exclaiming in joyful surprise: 'By Jove! it's Blew himself! Hallo! there, Harry! You're just the man I'm coming ashore to see.—Hold, starboard oar! Port oar, a stroke or two. Way enough!'

In a few seconds; the dingy is bow on to the gig; when Harry, seizing hold of it, brings the two boats side by side, and steadies them.

'Glad to see ye again, Master Willie. I'd just sighted the *Crusader's* signal for sailin', an' despaired o' havin' the chance to say a last word to yourself, or Mr Crozier.'

'Well, old boy, it's about that I've come ashore. Jump out; and walk with me a bit along the wharf.'

The sailor drops his oar, and springs out upon the pier, the young officer preceding him. When sufficiently distant from the boats to be beyond ear-shot of the oarsmen, Cadwallader resumes speech: 'Harry; here's a letter from Mr Crozier. He wants you to deliver it at the address you'll find written upon it. To save you the necessity of inquiring, I can point out the place it's to go to. Look along-shore. You see a house—yonder on the top of the hill?'

'Sartinly, I see it, Master Willie; and know who lives in it. Two o' the sweetest creeturs in all Californy. I s'pose the letter be for one o' them?'

'No, it isn't, you dog; for neither of them. Read the superscription. You see it's addressed to a gentleman?'

'Oh! it's for the gov'nor his-self,' rejoins Harry, taking the letter, and running his eye over the direction—Don Gregorio Montijo. 'All right, sir. I'll put it in the old gentleman's flippers safe an' sure. Do you want me to go with it now, sir?'

'Well, as soon as you conveniently can; though there's no need for helter-skelter haste, since there wouldn't be time for an answer, anyhow. In twenty minutes the *Crusader* will weigh anchor, and be off. I've hurried ashore to see you, hoping to find you at the ship-agent's office. How fortunate my stumbling on you here! For now I can better tell you what's wanted. In that letter, there's something that concerns Mr Crozier and myself—matters of importance to us both. When you've given it to Don Gregorio, he'll no doubt ask you some questions about what happened last night. Tell him all you know, except that you needn't say anything of Mr Crozier and myself having taken a little too much champagne, which we did. You understand, old boy?'

'Paritly, Master Will.'

'Good. Now, Harry; I haven't another moment to stay. See! The ship's beginning to shew canvas! If I don't get back directly, I may be left here in California, never to rise above the

rank of reefer. Oh! by the way, you'll be pleased to know that your friend Mr Crozier is now a lieutenant. His commission arrived by the corvette that came in last night. He told me to tell you, and I'd nearly forgotten it.'

'I'm glad to hear it,' rejoins the sailor, raising the hat from his head, and giving a subdued cheer; 'right glad; an', maybe, he'll be the same, hearin' Harry Blew's been also purmoted. I'm now first-mate o' the Chilian ship, Master Willie.'

'Hurrah! I congratulate you on your good-luck. I'm delighted to hear of it, and so will he be. We may hope some day to see you a full-fledged skipper, commanding your own craft. Now, you dear old salt, don't forget to look well after the girls. Again, good-bye, and God bless you! A squeeze o' hands, with fingers entwined, tight as a reef-knot; then relaxed with reluctance; after which they separate.

The mid, jumping into the dingy, is rowed back towards the *Crusader*; while Harry re-hires the truckman; but now only to stay by, and take care of his boat, till he can return to it, after executing the errand intrusted to him. Snug as his new berth promises to be, he would rather lose it than fail to deliver that letter. And in ten minutes after, he has passed through the suburbs of the town, and is hastening along the shore-road, towards the house of Don Gregorio Montijo.

#### CHAPTER XXIX.—DREADING A DUEL.

Once more upon the house-top stand Carmen Montijo and Inez Alvarez. It is the morning of the day succeeding that made sacred by their betrothal. Their eyes are upon the huge war-ship, that holds the men who hold their hearts, with promise of their hands—in short, every hope of their life's happiness. They could be happy now, but for an apprehension that oppresses them—causing them keen anxiety. Yesterday, with its scenes of pleasurable excitement, had also its incidents of the opposite kind; the remembrance of which, too, vividly remains, and is not to be got rid of. The encounter between the gamblers and their lovers cannot end with that episode to which they were themselves witness. Something more will surely come from it. What will this something be? What should it? What could it, but a *desafio*—a duel?

However brave on yester-morn the two señoritas were, however apparently regardless of consequences, it is different to-day. The circumstances have somewhat changed. Then, their sweethearts were only suitors. Now, they are affianced, still standing in the relationship of lovers, but with ties more firmly united. The young Englishmen are now their own. Inez is less anxious than her aunt, having less cause to be. With the observant intelligence of woman, she has long since seen that Calderon is a coward, and for this reason has but little belief he will fight. With instinct equally keen, Carmen knows De Lara will. After his terrible humiliation, he is not the man to shrink away out of sight. Blackleg though he be, he possesses courage—perhaps the only quality he has deserving of admiration. Once, she herself admired the quality, if not the man! That remembrance itself makes her fear what may come. She speaks in serious tone, discussing with her niece the

probabilities of what may arise. The delirious joy of yester-even—of that hour when she sat in her saddle, looking over the ocean, and listening to the sweet words of love—is to-day succeeded by depression, almost despondency. While conversing, they have their eyes upon the bay, watching the boats that, at intervals, are seen to put off from the war-ship, fearing to recognise in them the forms of those so dear. Fearing it; for they know that the young officers are not likely to be ashore again, and their coming now could only be on that errand they, the señoritas, so much dread—the duel. Duty should keep them both on their ship, but honour may require them once more to visit the shore—perhaps never more to leave it alive!

Thus gloomily reflects Carmen, imparting her fears to the less frightened Inez; though she too is not without some apprehension. If they but understood the 'Code of Signals,' all this misery would be spared them; for on the frigate's main-royal masthead floats a blue flag, with a white square in its centre, which is a portent that she will soon spread her sails, and glide off out of sight, carrying their *amantes* beyond all danger of duels or shore-scrapes of any kind. They see the 'Blue-Peter,' but without knowing aught of its significance. They do not even try to interpret or think of it, their thoughts, as their eyes, being busy with the boats that pass between ship and shore. One at length arrests their attention, and keeps it for some time fixed. A small craft, that leaving the ship, is steered direct for the town. It passes near enough for them to see that there are three men in it, two of them rowing, the other in the stern—the last in the uniform of an officer. Love's glance is keen, and this, aided by an opera-glass, enables Inez Alvarez to identify the officer in the stern-sheets as her own Don Guilielmo. This does not alarm the ladies so much as if the steersman had been Crozier. But he is not. The other two—the oarsmen—are only sailors in blue serge shirts, with wide collars, falling far back. For what the young officer is being rowed ashore, they cannot guess. If for fighting, they know that another and older officer would be with him. Where is Eduardo? While still conjecturing, the boat glides on towards the town, and is lost to their view behind some sand-hills inshore. Their glance going back to the ship, they perceive a change in her aspect. Her tall tapering masts, with their network of stays and shrouds, are half-hidden behind broad sheets of canvas. The frigate is unfurling sail! They are surprised at this, not expecting it so soon. With the help of their glasses, they observe other movements going on aboard the war-vessel: signal-flags running up and down their haulyards, while boats are being hoisted to the davits. While watching these manœuvres, the little craft which carries the midshipman again appears, shooting out from behind the sand-hills, and being rowed rapidly back to the ship, the young officer still in it. On reaching the great leviathan, for a short time it shews like a tiny spot along her water-line; but, soon after, it too is lifted aloft, and over the bulwark rail.

Ignorant as the young ladies may be of nautical matters, they can have no doubt as to what all this manœuvring means. The ship is about to sail! As this is an event which interests all the

family, Don Gregorio, summoned to the house-top, soon stands beside them.

'She's going off, sure enough,' he remarks, after sighting through one of the glasses. 'It's rather strange—so abruptly!' he adds. 'Our young friends said nothing about it last night.'

'I think they could not have known of it themselves,' says Carmen.

'I'm sure they couldn't,' adds Inez.

'What makes you sure, *nina*?' asks Don Gregorio.

'Well—because'—stammers out the Andalusian, a flush starting into her cheeks—'because they'd have told us. They said they didn't expect to sail for a day or two, anyhow.'

'Just so; but you see they're setting sail now—evidently intending to take departure. However, I fancy I can explain it. You remember they spoke of another war-ship they expected to arrive. Yonder it is! It came into port last night, and, in all likelihood, has brought orders for the *Cru-sader* to sail at once. I only wish it was the *Condor*! I shan't sleep soundly till we're safe away from'—

'See!' interrupts Carmen; 'is not that a sailor coming this way?' She points to a man, moving along the shore-road in the direction of the house.

'I think so,' responds Don Gregorio, after a glance through the glass. 'He appears to be in seaman's dress.'

'Will he be coming here?'

'I shouldn't be surprised; probably with a message from our young friends. It may be the man they recommended to me.'

'That's why somebody came ashore in the little boat,' whispers Inez to her aunt. 'We'll get *billetes*. I was sure they wouldn't go away without leaving one last little word.'

Inez's speech imparts no information; for Carmen has been surmising in the same strain. The aunt replies by one of those proverbs, in which the Spanish tongue is so rich: '*Silencio! hay Moros en la costa*' (Silence! there are Moors on the coast).

While this bit of by-play is being carried on, the sailor ascends the hill, and is seen entering at the road-gate. There can now be no uncertainty as to his calling. The blue jacket, broad shirt-collar, round-ribbed hat, and bell-bottomed trousers, are all the unmistakable toggery of a tar. Advancing up the avenue in a rolling gait, with an occasional tack from side to side—that almost fetches him up among the manzanitas—he at length reaches the front of the house. There stopping, and looking up to the roof, he salutes those upon it, by removing his hat, giving a back-scraps with his foot, and a pluck at one of his brow locks.

'*Que quieres V., señor?*' (What is your business, sir?) asks the hacienda, speaking down to him.

Harry Blew—for it is he—replies by holding out a letter, at the same time saying: 'Your honour, I've brought this for the master o' the house.'

'I am he. Go in through that door you see below. I'll come down to you.'

Don Gregorio descends the *escalera*, and meeting the messenger in the inner court, receives the letter addressed to him. Breaking it open, he reads:

**ESTIMABLE SEÑOR**—Circumstances have arisen that take us away from San Francisco sooner than we expected. The corvette that came into port last night brought orders for the *Crusader* to sail at once; though our destination is the same as already known to you—the Sandwich Islands. As the ship is about to weigh anchor, I have barely time to write a word for myself, and Mr Cadwallader. We think it proper to make known some circumstances which will, no doubt, cause you surprise, as well as ourselves. Yesterday morning we met at your house two gentlemen—as courtesy would then have required me to call them—by name, Francisco de Lara and Faustino Calderon. We encountered them at a later hour of the day, when an occurrence took place, which absolved us from either thinking of them as gentlemen, or treating them as such. And still later, after leaving your hospitable roof, we, for the third time, came across the same two individuals, under circumstances shewing them to be professional gamblers! In fact we found them to be the proprietors of a Monté bank in the notorious El Dorado, one of them engaged in dealing the cards! A spirit of fun, with perhaps a spice of mischief, led me into the play, and betting largely, I succeeded in breaking the bank. After that, for a short while we lost sight of them. But as we were making our way to the wharf, where our boat was to meet us, we had a fourth interview with the ‘gentlemen,’ who on this occasion appeared with two others in the character of *robbers* and *assassins*! That they did not succeed in either robbing or murdering us, is due to the brave fellow who will bear this letter to you—the sailor of whom I spoke. He can give you all the particulars of the last and latest encounter with these versatile individuals, who claim acquaintance with you. You may rely on his truthfulness. I have no time to say more.

Hoping to see you in Cadiz, please convey parting compliments to the señoritas—from Cadwallader and yours faithfully,  
EDWARD CROZIER.

The letter makes a painful impression on the mind of Don Gregorio. Not that he is much surprised at the information regarding De Lara and Calderon. He has heard sinister reports concerning them, of late so loudly spoken that he had determined on forbidding them further intercourse with his family. That very day he has been displeased on learning of their ill-timed visit. And now he feels chagrin at something like a reproach conveyed by that expression in Crozier's letter, ‘These versatile individuals who claim your acquaintance.’ It hurts his hidalgo pride. Thrusting the epistle into his pocket, he questions its bearer, taking him to his private room, as also into his confidence. The sailor gives him a detailed account of the attempt at murder, so fortunately defeated; afterwards making known other matters relating to himself, and how he has taken service on the Chilean ship—Don Gregorio inquiring particularly about this.

Meanwhile, the young ladies have descended from the azotea, and the ex-man-o-war's-man makes their acquaintance. They assist in shewing him hospitality, loading him with pretty presents, and knick-knacks to be carried on board the *Condor*, to which they know he now belongs. As he is about to depart, they flutter around him, speaking

pleasant words, as if they expected to get something in return—those *billetitas*. And yet, he goes away without leaving them a scrap. A pang of disappointment—almost chagrin—shoots through the soul of Carmen, as she sees him passing out of sight. And similarly afflicted is Lúez; both reflecting alike.

Still they have hope; there may be something inclosed for them in that letter they saw Harry holding up. It seemed large enough to contain two separate notes. And if not these, there should at least be a postscript with special reference to themselves. Daughters of Eve, they are not long before approaching the subject, and drawing Don Gregorio.

Yes; there is something said about them in the letter. He reads it: ‘*Parting compliments to the señoritas.*’

#### SAFES AND SAFE-DEPOSIT STRUCTURES.

A remarkable building just finished in the very heart of the city of London illustrates the great solicitude felt for the safety of articles which possess a high money value as compared with their bulk. Among such articles are various kinds of paper-money or representatives of money; such as bank-notes, Exchequer bills, bills of exchange, share certificates, debenture bonds, loan-notes, share coupons, and the like. A small flame, such as the light of a candle or of a gas-jet, would consume thousands of pounds' worth of such pieces of paper in a few minutes, or even seconds; while the breast-pocket of a thief would afford a snug hiding-place for an equal amount. Another class of small valuables would be jewellery and articles of goldsmiths' work, together with gold and silver watches and chronometers. But there are many other kinds of paper and parchment documents, and of manufactured goods made of other materials than precious stones and precious metals, which it is of great consequence to preserve intact, shielded alike from fire and from thieves.

Although well known to bankers, large commercial firms, jewellers, and goldsmiths, it is but partially known to the public how great has been the ingenuity shewn in the manufacture of iron receptacles that will protect valuables. After a devastating fire that has baffled all attempts at fire-resistance, the makers of iron safes tax their powers of invention to devise something more secure than was before known; and after a burglary of more than usual daring, the same ingenuity is set to work to baffle more successfully the drill, the chisel, the crowbar, and the sledge-hammer. The locksmiths are expected to do their own part of the work, by producing locks that will defy picking and bursting open. The making of safes is a separate trade, intended to grapple alike with both enemies—fire and burglars.

It might seem that chemistry could not have much to do with the making of plate-iron strong-boxes and strong-rooms; nor has it, so far as regards thief-resisting qualities; but in making such receptacles fire-proof, many facts discovered by scientific chemists have been utilised in a remarkable degree, sometimes very successfully. A fire-proof composition is used as a lining for some safes; while in others the heat of any conflagration to which the safe may be exposed brings about chemical changes of a fire-resisting character.

Frequently the case is made hollow or double, and a stuffing or damper thrust in between the two thicknesses. Patentees have selected a large diversity of substances to form this stuffing: sand, sawdust, burnt clay, powdered charcoal, dust, fragments of stone, baked wood-ashes, small gravel, bone-dust, ground alum, gypsum, cement—all are adopted by different inventors. In one form, a specially chosen liquid is placed in some part of the interior of the safe; an external fire, greatly heating the iron, would burst the vessels containing the liquid; and the liquid, saturating the powdery composition used as stuffing, would render it fire-resisting in a high degree. Many inventors have turned their attention to the power of developing a vapour in the double jacket of the safe, by the effect of external heat: a vapour that will retard the intense heating of the interior of the safe, the space wherein the valuables are placed. Steam, the vapour of mere water, is known to possess this damping quality; and some chemical salts and liquids possess it in a still higher degree.

Many of the safes now made are rooms or chambers rather than chests or boxes, and claim to be thief-proof and fire-proof in an extraordinary degree. One, made for a banking company, is seven feet wide, seven feet high, and nine feet deep, constructed of wrought-iron, and lined or jacketed with fire-resisting composition; the interior space contains nineteen separate and distinct lock-up safes, besides shelves for books and papers; the massive folding-doors of the front are provided with three detector locks, which throw thirty bolts all round. We have seen a safe or strong-room, made for a goldsmith, far exceeding this in size; it has walls of concrete as well as of slab iron; it has a canal of water within the outer skin; and if any attempt be made to pierce this skin with a drill, an electric apparatus is set into action which keeps a small bell ringing—effectually disturbing the quietude of a burglar. Messrs Milner have constructed safes or magazines for gunpowder, which have preserved the contents intact even when exposed to the fiercest flames ever known to fire brigades. The government caused experiments to be made on these safes, in the open marshes near Woolwich. The jacket of each safe contained alum and sawdust: alum has the property of liquefying when exposed to a high temperature; this liquid saturates the sawdust; vapour arises, and is admitted through small apertures into the interior space, where it thoroughly wets the contents, cools them, and thus preserves them. At the experiments in question, Major Majendie, of the Royal Artillery, put into each of the safes several canisters of cartridge-charge. After six hours' exposure to intense heat—so intense as in two places to burn through an exterior skin of half an inch of iron—the safes were allowed to cool. When opened, he found that several sticks of alloy, capable of bearing temperatures varying from three hundred and forty to six hundred degrees Fahrenheit, were unmelted; that a register thermometer had not risen higher than two hundred and ten degrees Fahrenheit; that the exterior of the canisters was quite wet with steam; and that the gunpowder contained in them was uninjured. We may suitably mention that burglars occasionally blow open safes by exploding a little gunpowder introduced into the keyhole of the lock; and that

lock-makers, to baffle this manœuvre, are trying methods of closing the keyhole against the intrusion.

A contest of a singular character took place at Paris in 1867, in connection with the grand International Exhibition in that city. It was a struggle between two makers of bankers' safes. At the time of our Hyde Park Exhibition in 1851, the rivalry had been about locks; the world being called upon to decide whether Mr Bramah could make a lock that would defeat Mr Hobbs; or whether Hobbs could pick any and every lock that Bramah could make. The result of that and later trials was to shew that, though experienced locksmiths can pick *any* lock if abundance of time be allowed to them, the best makers can now pretty successfully frustrate burglars, so far as concerns picking locks within anything like a short space of time. The owners of good safes provided with good locks were satisfied; and for many years had reason to be so. In 1865, however, the shop of a watchmaker and jeweller in Cornhill was plundered one night by burglars, notwithstanding the fact that most of the valuables had been placed in an iron safe of great strength. Subsequent investigations shewed that the elaborate lock, made by one of the most distinguished makers, had not been tampered with; the iron door of the safe had been wrenched open, by a peculiar application of chisels and a crowbar. A civil engineer, writing to the public journals, explained how this could be done; the safe-maker denied its possibility; but the chief burglar, who afterwards made a confession, stated that he had employed the identical plan described by the civil engineer.

Bankers, goldsmiths, and other owners of property small in size but great in value, were rendered uneasy by these revelations; they found that though locks might be invulnerable to pickers, safes were not proof against forcing. Thereupon the safe-makers set to work to produce safes that could not be forced open by any probable employment of chisels and crowbars. The Patent Office affords proof of the activity here displayed; and specifications of modifications in strong-rooms and boxes abound. It had been admitted for many years that safes could be made fire-proof; but now the question related to burglar-proof. Two exhibitors at Paris in the year above named, an Englishman and an American, put forth challenges; large sums of money were deposited; judges and umpires were chosen; the American, aided by three men, was to try to force open the best safe exhibited by the Englishman; the latter, with an equal number of men, was to try conclusions with the American's best safe; and money and reputation were to reward the victors. The American brought three skilful and educated German workmen; the Englishman brought three strong but uneducated men: the former had a large store of beautiful tools; the latter, a smaller store of rougher tools; and a debate arose as to whether these relative advantages were fair. Preliminaries being at length settled, the Germans set to work upon the English safe. They tried the lock, but failed to open it; they endeavoured to drill a hole through the door, but found the layers of steel with which it was intersected baffled them; they tried wedges at the edge of the door, but could not drive them in. Frustrated in the front of the

safe, they turned their attention to one side, which was composed of four skins of tough metal bolted together. These they burst asunder one after another, by applying chisels to the dovetail joints, dealing heavy blows upon them, and loosening bolt after bolt. After four hours of very hard work they succeeded in making an opening wide enough for the abstraction of a sanded packet which had purposely been placed by the maker on a shelf within. If they had made no attempt on the door, they would have saved an hour; if the packet had been placed in the drawer instead of on a shelf, their work would have been prolonged; but as matters stood, they broke open the stronghold in four hours.

Meanwhile the Englishmen were trying their skill on the American safe, which was double, a burglar-proof safe inclosed in one that was fire-proof. Half an hour was consumed in opening the outer one; and then the inner was seen, much stronger in build, and difficult to get at. The men, as before observed, were but slenderly provided with good tools; nevertheless the inner safe was broken into in about four hours and a quarter. The victory lay with the maker of the American safe, with about a quarter of an hour to spare. The English safe, however, having successfully resisted the attack from the front, and only yielded when battered and wrenched on the side—which in practice is usually protected by masonry, and thereby beyond the reach of attack—was considered the better of the two by practical men.

Without going into further details concerning strong-rooms and safes, we proceed to describe a structure, just finished, which is to be a perfect magazine of such things, a stronghold full of strongholds, defying alike fire, water, gunpowder, and burglars.

The building constructed for this treasure-deposit purpose is in the very centre of the city of London, and stands upon ground purchased at a price nearly equivalent to one million sterling per acre. When the Thames Embankment was finished from Westminster Bridge to Blackfriars Bridge, and Queen Victoria Street from thence to the vicinity of the Bank, a triangular space of ground was laid bare, every square foot of which had been associated with commercial houses of great wealth. Facing the western front of the Mansion House on one side, and close to the Poultry, Bucklersbury, and Walbrook, it was just in the midst of those establishments which require strong-rooms or receptacles for the safe custody of monetary and commercial documents, as well as precious metals and jewels. America furnished many hints which have been utilised in this instance. When a Safe-deposit Company was formed, with three or four bankers among the directors, Mr Graves, the lately deceased member of parliament for Liverpool, travelled through the United States of America, where, from Maine in the east to California in the west, most of the large commercial towns possess Safe-deposit institutions of a more or less analogous kind. Mr Gray, the Managing Director of the new Company, has taken advantage of the information thus obtained in organising the general plan of the structure. Dr Pole, Professor of Engineering, and General Gossett, of the Royal Engineers, assisted in establishing the conditions necessary for fire-proof and burglar-proof construction; Messrs

Easton undertook the engineering construction, while Messrs Peto were responsible for the brick and stone work.

It is, we believe, quite correct to say that there is more work below ground than above, in the costly building just completed; at anyrate, the excavation made was of vast depth, and the honeycomb of chambers which fills it has been the result of more thought and labour than the above-ground structure. If it realises the expectations which are entertained, this subterranean portion will deserve the titles sometimes given to it—a fortress, a citadel, a stronghold that will defy all assailants.

The building has three frontages, and is entirely isolated, no other structure being within many yards of it. The above-ground portion much resembles in appearance many of the banking-houses and insurance offices in the City, and need not be particularly described. The core of the underground citadel or fortress is about seventy feet by thirty-two, and thirty-six feet deep; it has passages all around it, vaults underneath it, and passages over, inasmuch that every part can be examined by the armed watchmen who will patrol the place day and night. The side-walls of the citadel are six feet thick, and built of the hardest bricks that can be made; they are backed by a mass of concrete almost as thick, and lined with armour-plates that would suffice for many of the Queen's iron-clads. One can hardly imagine any process of surreptitious drilling that would penetrate twelve or thirteen feet of such wall; nor is it easy to see how fire could work much destruction, seeing that there is scarcely an atom of woodwork anywhere near. If any riot or tumultuous attack occurred, access down to the citadel would be no easy matter, seeing that the roof is formed of bomb-proof, semicircular arches; even the subterranean operation which military engineers call mining has been provided against, for the whole citadel is surrounded by water, which would frustrate if not drown any invaders.

This citadel, then, beneath the level of the street, is the stronghold in which valuables are to be deposited; and now we have to notice the manner in which its cubical interior space is divided and subdivided. The space is arranged in four floors or stories, each covering about nine thousand square feet. The two upper floors are set apart for safes of small or moderate size, of which a supply of more than ten thousand is provided. These safes are let to the public, at rentals varying from fifty shillings to thirty pounds per annum each, according to size and other circumstances; they vary in frontage from a few inches square to two feet square, but all are alike twenty inches deep from front to back, and all are fixtures. Every safe has a lock differing from that of every other safe in the place; and whenever a new renter takes possession of a safe, a new lock is put to it, or an alteration made in some of the interior mechanism of the old one. The renters can obtain easy access to their safes during business hours; and small compartments or recesses are provided, to afford facilities for examining securities, cutting off coupons, &c. The two lower floors or stories are appropriated to plate-chests and bulky boxes, which do not need to be often disturbed or opened; and to valuables placed under the immediate care of the Company. A special tariff is charged for these latter, seeing that

the Company hold themselves responsible for the safety of the treasures—plate, jewels, works of art, or what not—intrusted to them.

The doors by which the citadel and its range of four floors are entered were a matter of anxious deliberation with the architect, Mr Whichcord. As a rope is no stronger than its weakest part, nor a chain than its weakest link, so is a strong-room no stronger than its weakest part—which is usually the door. A plan was formed for a series of iron doors to work upon hinges, and to be fastened with locks and bolts; but it was found that their manufacture would occupy a longer time than was convenient either to the Company or to the builders. The architect thereupon resolved to dispense alike with hinges, locks, and bolts, so far as these doors are concerned. Each door is a solid mass of the toughest rolled iron, nearly twelve inches in thickness; they slide instead of turning on hinges, and their enormous weight renders locks and bolts unnecessary. A simple agency (we believe hydraulic) suffices to open these doors at the commencement of each day's business, and to close them again when the busy hours of City work are over. For the various stories, floors, or 'flats' of the citadel, there are no fewer than thirty-two of these doors, each of which weighs four tons. The iron is of the hardest kind known in the present state of metallurgy. In order to test what a burglar might or might not be able to accomplish, a skilled workman was employed to do his best in drilling one of these formidable slabs; in fourteen hours he was only able to penetrate one inch of iron, after breaking or blunting eighty-six drilling-tools.

The value of such an establishment can only be tested by long-continued experience; but the prospect is certainly favourable. It is now announced that Manchester is about to try its hand at a similar work.

### THE GIRL HE LEFT BEHIND HIM.

THE good ship *Tamar* was bearing up Channell before a brisk south-west wind. The passengers were gathered on deck, conversing in little groups, as they stood watching the green English shores, lying bright and still in the afternoon light. But one stood apart from the rest, leaning over the stern taffrail, gazing with fixed eyes and thoughtful face. He was a man of about forty-five years of age, of somewhat spare build, with an ample brown beard, and bronze-tanned cheeks. A near scrutiny would have revealed something of sadness in his eyes at the moment, as though the prospect of again setting foot on his native land, from which he had been absent for many years, was not wholly one of pleasure. It was not only the green English shores that he saw as he gazed from the vessel's deck; all day, ever since the ship had passed Plymouth, a vision, summoned up by the memories which the thought of that town brought back, had been floating before his eyes. He saw a cottage on the outskirts of the town, with a garden sloping to the sea. In the soft twilight of the June day, two figures, a youth and a girl, stood in the garden beneath the lime-trees. They were bidding each other farewell with many protestations of undying love and constancy, spoken from the heart in the case of both. Circumstances were sending the youth from his home to try his fortune

in a far-away land. But he would return, and take the girl, his accepted wife, back with him; and meanwhile she could wait contentedly, assured of the strength of his constancy and her affection. He had gone away, and—well, events had not turned out quite as the youth and the girl had intended.

George Herder had then looked forward to returning to England with somewhat different feelings from those which he was at present experiencing. Instead of thoughts of wedding-bells, he was coming back with no deeper sentiment in his heart than a desire to see once more the friends and home of his boyhood, before finally settling in the country of his adoption, where he had formed stronger ties, he thought, than any that now existed for him in the land of his birth. And yet a dimness gathered in his eyes as the past came back upon him, and his memories were neither gloomy nor misanthropic.

On the afternoon of the following day, the *Tamar* dropped anchor off Gravesend. Most of the unmarried men on board went on shore at once, and among them George Herder. On reaching London, he took a cab, and gave the man the address to drive to. He was set down in Hereford Road, Bayswater, at a house in a terrace. He gave the servant who opened the door his name, and following her up-stairs, entered the room into which she shewed him. As he did so, a man rose from the table at which he was seated, glanced for a moment at the stranger, and then came quickly forward, and grasped him by both hands.

'George, old man, it is you. Welcome back to England. But I can't tell how I feel at seeing you again, old fellow!'

'Did you get my telegram?' asked Herder.

'Yes, I got it. I have been talking to my landlady, and she can let you have a bedroom here, if you like, and we can share this room in common. The arrangement might suit you for the present, at anyrate. What do you say?'

'It will do capitally,' answered Herder. 'It will be convenient our being together, for we have much to say to each other. I'll need to be piloted about London too; I've forgotten my way greatly, and I find many of the places changed.'

'I thought of that too. I'm not very busy just now, so we can have a good deal of time together. I shall be free every afternoon by four o'clock.'

Fred Hammond held a position of some responsibility in the Civil Service. Next day, George Herder's time was chiefly occupied in looking up the few friends in London with whom he had kept up an acquaintance by correspondence. Hammond and he had finished dinner in their lodgings, and had produced their pipes, when the former said: 'I've got an engagement for this evening, which it's too late now to think of getting off. Some very good friends of mine, who live in a square close by, have a sort of musical party and conversation. I am on quite such terms with them as to be able to use the freedom of taking you with me, if you would care to go. I can't promise that you will be greatly interested among a lot of people who are strangers to you; but we need only stop an hour or so, and it may be less dull than staying here by yourself. However, if you don't feel inclined for it, you must try and find something to amuse you till I come back, and I'll get

away as soon as possible. There are two or three of this month's magazines on the table yonder.'

'I don't mind going with you for a short time, if you can use the liberty of introducing me to your friends,' said Herder.

'All right, then; we'll finish our pipes, and it will then be about time to fix ourselves.'

Mrs Norcott entertained a sufficient number of guests that evening to fill her drawing-rooms comfortably without crowding. Music, conversation, and cards for the more elderly of the company formed the staple of the evening's amusements. The host and hostess received Herder with agreeable geniality; but as the people about him were all entire strangers, it could hardly be otherwise than that George should every now and then feel somewhat at a loss what to do with himself. He had exchanged a few commonplaces with an old Indian officer to whom he had been introduced, and was standing in a corner of the room gazing rather aimlessly about him, when Hammond came up and said: 'I'm afraid this isn't very lively for you, but I think we need not stay any longer. I've explained matters to Mrs Norcott. I just want you to hear this lady play, and then we'll go. She is one of the best amateur pianoforte-players I know, and I always consider it a treat to hear her. You used to be fond of music; I think you'll like this.'

The piano stood at the opposite end of the room. While Hammond was speaking, a lady seated herself at it and began playing. As Herder looked at her he started so evidently, that it did not escape his companion's notice. Was it possible that he knew that face and figure? The lady was middle-aged, of a rather small and slight figure, with a face not regularly moulded, but soft, refined, and expressive; brown hair, with a ripple in it, and brown eyes. The face had lost the rounded curves of girlhood, and all the colour that once mantled in it; the eyes had somewhat faded; and there were not wanting lines upon the brow; but surely George could not be mistaken. The light from a bracket above the piano fell upon the player, and revealed her face and figure in clear outline. She played an arrangement of Irish melodies, old and familiar airs all of them, but so delicately and sympathetically played, that the whole room was hushed to listen. Conversation ceased for the time; and several of the card-players from the adjoining room, abandoning their game, came forward and stood at the doors while the music continued. It was evident that the skill of the performer was well known to many of the company. Herder listened with rapt ears. The music was stirring old memories in his heart, reviving them with a strange power. If anything had been needed to confirm him in his recognition of the performer, the music she had happened to choose would have done so. Were not some of these old airs once his chief favourites, airs that used to haunt him for days together, and that still came back upon him now and then? The music ceased; a murmur of applause went round the room, and the performer rose and left the piano.

'That lady plays admirably,' observed Herder to his companion, with an effort to appear calmer than he really felt.

'Ah! I thought you would like her,' answered Hammond. 'The music is simple enough; but

whatever Mrs Vallance plays is played in a way you don't often meet with.'

'Vallance! Are you sure that is the name?' asked George, and the disappointment in his voice was evident.

'Perfectly,' replied Hammond, a little surprised. 'I know her very well. Why do you doubt it?'

'Oh, it's of no consequence; I suppose I was mistaken; but it's very strange.' The last part of Herder's sentence was spoken in an absent, half-musing way, as though the speaker had grown suddenly unconscious of his companion's presence.

'What is strange?' said Hammond. 'You seem greatly interested in Mrs Vallance, George. What is the mystery?'

'Have you known Mrs Vallance long, Fred?'

'Yes; and I have the pleasure of knowing her pretty intimately. There is somewhat of a little history connected with her.'

'Is there? Would you mind telling it to me, if it is not a private matter?'

'Certainly, if you wish; it is no secret. But we can't talk here. Let us find Mrs Norcott, and make our adieus.'

'I can tell you what I know of Mrs Vallance,' began Hammond, when the two men had reached their lodgings and were again seated, each in an easy-chair, at the open window, for it was summer-time, 'in a few sentences, for it is after all a simple enough story. When Mrs Vallance was a girl of twenty, she was engaged at Plymouth, where she resided, to a young fellow a few years older than herself. Unfortunately, however, he had not the wherewithal to keep a wife, and with the hope of increasing his worldly circumstances more rapidly than he was doing in England, he resolved to emigrate to Australia. He was to return in a short time and take the girl out with him. In Australia he started sheep-farming, I believe; but his success was by no means so rapid as he had hoped for. Years passed on, and still there seemed no prospect of his being soon able to return to England. At last the girl received a letter in which her affianced lover—whose name I never happened to hear—stated that he could not possibly say when he would be in a position to fulfil his promises to her. Under these circumstances, he could not ask her to wait any longer for him; and he therefore released her from her engagement. Well, the girl was sad and depressed enough for a while, they say, but by-and-by she seemed to get over it. About this time, Mr Vallance, an old friend of the father's, came a good deal about the house, and it was soon evident that he was attracted by the daughter. Vallance was a partner in a long-established mercantile house in London, and was reputed to be rich. He was a kind-hearted and estimable man in many ways. The parents looked favourably upon his suit, and when he proposed for the daughter's hand, she accepted him. They were married. Mr Vallance took a handsome house in London, and made a kind husband and a generous son-in-law. But this prosperous condition of things did not last long. In little more than two years after his marriage, the house to which Vallance belonged, to the astonishment of the mercantile world, stopped payment. The affair made a considerable talk in the City at the time. Nobody seemed to have anticipated

the firm's failure, and I don't think Mr Vallance could have had any thought of the possibility of such a change in his circumstances when he married his wife, from the way he took the matter to heart. He never recovered from the shock, and in a year after the firm had suspended payment, he died. His widow was left almost entirely dependent upon her own exertions for the support of herself and her two young children. She removed to Plymouth again, began to give music-lessons, and in this way has maintained herself and family ever since; and very nobly she has done it. It was shortly after her husband's death that I became acquainted with her. I have given you the most favourable version of her story. As regards her engagement with Mr Vallance, there were not wanting people in Plymouth who hinted their doubts at the time as to whether she had ever received such a letter as I have mentioned from the young fellow in Australia. Gossips said that she lent a willing enough ear to Mr Vallance's addresses.'

'Was that the general report?' asked Herder.

'Well, it was not uncommon to hear the matter talked of in that way.'

'And what is your own opinion?'

'There is no lady of my acquaintance for whom I have a greater respect and liking than for Mrs Vallance,' answered Hammond; 'and I would not believe anything unworthy of her. But it is perhaps too much to expect from average human nature, and I don't claim anything ideal for Mrs Vallance, that a woman should be able to keep up a strong affection for a man away in Australia for a number of years, and under the cheerless conditions I have described, with nothing to feed it on but an occasional letter. No doubt, the girl's sentiment lasted longer than the young man's. Possibly, she may not have received such a letter; and what Mr Vallance could offer her, everything that is pleasant and attractive to a woman, may have had its effect. Her father's worldly circumstances too, which were latterly not in a very prosperous state, would very likely have an influence in the matter.'

There was a short pause, during which the two men puffed their pipes in silence. Then Herder said: 'I think a life spent as mine has been has at least one advantage over yours, Fred—it is not so apt to make a man become so rapidly sceptical about everything, as one passed in cities; not so prone to think that people are much the same everywhere, or so content to assign the least noble motives for human action. Now, in this case of Mrs Vallance, I am able to inform you that both common report and yourself were wrong, at least in one important respect. Miss Maurice—that was the young lady's maiden name, I think, though you did not mention it—did receive such a letter as you describe, from her friend in Australia; a letter, too, that released her completely from her engagement.'

'And how on earth do you know all this?' asked Hammond.

'For the simple reason, that I am the young fellow that went to Australia.'

'You, George!' exclaimed Hammond, starting from his chair, and staring in his companion's face. 'How is it I never heard a word of this before? I thought we knew most of each other's affairs, as young men.'

'Well, Fred, for a year before I became engaged

to Miss Maurice, you were in Germany with your mother and sister; and I was away, you know, before you came back. I never mentioned my acquaintance with Miss Maurice to you; I was rather a shy and shamefaced fellow, somehow, about that sort of thing, and I did not tell even so close a chum as you about it, though I was on the point of doing so when I started so suddenly for Australia. After that, I felt the less inclined to write about the subject; my prospects were so vague and uncertain in every way.'

'It was rather strange, George, that I never heard your name mentioned in the matter, and there was nothing to make me think of connecting you with Miss Maurice's friend. You knew Mrs Vallance again, then, to-night? I could not think what made your manner so odd.'

'Yes, I knew her. She is much changed, of course, though not more so, I suppose, than was to be expected. I left behind me a girl of twenty, with a bloom on her cheek like a June rose, and eyes like sunshine. Both the rose-red and the light in her eyes have faded; but she is still Kate Maurice, the same sweet-looking woman I knew long ago. One thing only made me hesitate to-night as to whether I was not mistaken, after all, and I don't understand it yet. I heard in Australia that the man Miss Maurice married was a Mr Ewing; but I suppose there was some mistake about the name.'

'It was a mistake,' said Hammond; 'but I can see how it probably occurred. The title of the firm of which Mr Vallance was a junior partner was Griffith and Ewing. Your informant must have heard that Miss Maurice married the junior partner, and concluded that it was Mr Ewing, or the story got mixed up in some such way.'

'Yes; the more easily as it had passed through several mouths by the time it reached me.'

'And I suppose that letter of yours expressed the real state of things with you at the time?'

'Exactly; you have got the gist of the letter quite correctly. When I wrote that, I saw no prospect for years to come of being able to marry. When things did at length take a turn in the right direction with me, I made fair progress. And now, though I am not a wealthy man, I have as much as I had any right to expect.'

'Well, George, how is this little story of yours to end?' and as Hammond spoke, he looked quietly into his friend's face, but with not a little curiosity.

'Ah, how?' answered the other, and the friends again for a little relapsed into silence.

'Is Mrs Vallance staying in London for any time, do you know?' inquired Herder presently.

'She has been paying a short visit to Mrs Norcott, and is to return home in a day or two, she told me,' replied Hammond. 'When do you think of going to Plymouth yourself?'

'This is Wednesday; I think I shall go on Friday or Saturday. When I have got my things out of the ship, and arranged one or two small matters of business, I shall have nothing further to keep me in London, and I am anxious to see my old aunt. She is almost my only relative now left. I was a favourite of hers, you remember.'

'I think you are perfectly right in visiting her at once,' Hammond answered quietly.

The Friday evening following found Herder at

Plymouth. Early next morning, he visited his aunt, and one or two old friends, and then made his way in the direction of the house in which he had spent his boyhood. It lay two or three miles out of the town, among fields and low hills, and Herder found it again without difficulty. A few villas had sprung up in the neighbourhood, but otherwise the place and the surroundings were little altered. Time had been less busy in this part of the vicinity of Plymouth than in most others. George walked round the house, stood gazing over the low garden-wall for a while, and then strolled away in the direction of the hills in the rear. By-and-by he came upon a stream flowing between grassy banks, and shaded by willow trees. The recollections of the place came fully back upon him now, and he recalled point after point in the landscape. As he followed the windings of the stream, he felt himself once more on familiar ground, and he almost forgot for the moment the years that had elapsed since last he trod these same paths. He had fallen into the sort of reverie which the circumstances naturally induced, when he reached a point where the stream widened into a little pool, with an overhanging rock on one side, and on the other a close line of willows, whose drooping boughs swept the clear-brown waters beneath. A boy who was on the bank fishing, looked up as Herder approached. He had a frank, intelligent face and brown waving hair.

'Good sport this morning?' asked Herder, accosting him.

'Not first-rate,' and the speaker lifted the lid of the small creel that lay on the grass beside him, for the stranger's inspection of the morning's take.

'This used to be a good spot, and this is not a bad morning either; a little bright, perhaps,' continued Herder.

'The river isn't so good as it was once, I think, sir; at least if all the stories old fishermen tell of it are true; but I daresay these old chaps either forget or exaggerate. I get a good lot of fish sometimes, though generally higher up than this. Do you ever fish here, sir? I never saw you.'

'I did once,' answered George; 'I think I knew every yard of it from this to the Bridgend Inn. Is the inn still to the fore?'

'O yes; but I suppose it would be old Marley who kept it when you were a boy, sir? His nephew, Fred, has it now.'

'Ah! so old Dave is gone.'

The two fell into a conversation about trout-fishing and all pertaining to it. In a little the youth left the pool, and moved slowly up the stream, Herder walking by his side—a frank, bright, intelligent boy, who gossiped on with the open-hearted freedom of an English youth. What was it in the tones of his voice, every now and then, that puzzled Herder with a faint sense of familiarity? He looked more narrowly at his companion's face, and as he did so, another face came slowly back, and filled his mental vision. A strong desire to learn his young companion's name possessed him, and he asked it.

'John Vallance,' was the answer. 'May I ask yours, sir?'

George seemed to hear the words with no feeling of surprise, but he was conscious that his interest in the youth beside him deepened with the con-

fimation of his suspicion. He hesitated for a moment, and then told his surname.

'Herder,' repeated the youth; 'I know that name. There's an old lady, Miss Field, who lives near us, a great friend of my mother's, who has a nephew named Herder. She often talks of him. George, she always calls him. But he's in Australia; been there for ever so long.'

Herder did not answer; the two resumed their talk upon fishing, and from that it turned upon other subjects. Herder encouraged young Vallance to talk, and gradually drew from him the leading particulars of his life. He spoke of his mother, his sister Katy, himself and his school-life, freely and unconstrainedly, for there was nothing to conceal.

The two had now reached the Bridgend Inn, a small, old-fashioned-looking hostelry, frequented by anglers, standing close to the bank of the stream, where it was crossed by a rustic wooden bridge. Herder and John Vallance entered the cool, little, sanded parlour, and George ordered some refreshment. The host brought them cold meat, bread and cheese, and a jug of beer; and off these simple viands the two made a merry lunch together. When Herder had paid for the refreshment, and John and he were leaving the inn, after chatting for a moment with the landlord, George said to his companion: 'It's time I were making my way to Plymouth again. There used to be a short path back to the town from here, across the hills. But I don't think I could find it myself, now.'

'Yes,' answered John; 'I can put you upon it in a few moments. I shall keep along the river for a bit longer, I think. There's the road, sir. Keep straight ahead, and it will take you into the town.'

'I am to be in Plymouth for a few days longer,' said Herder, 'and I hope we shall see each other again.'

'I hope so too, sir,' answered the boy heartily.

The two new friends parted very cordially.

Before Herder reached the town again, he had resolved to visit Mrs Vallance. When he had parted from his aunt in the morning, she had told him he should do so, and he had answered her with a half-promise, not himself certain that he wished to follow her advice immediately, though the intention of making himself known sooner or later to Mrs Vallance had been in his thoughts since his conversation with Hammond. The events of the morning had had the effect of quickening his intention. He knew the cottage in which Mrs Vallance lived; he had been directed to it by Miss Field, and he had to pass it in returning to his aunt's house. He rang the bell; and instead of its being answered by a servant, the door was opened by Mrs Vallance herself. The single maid-servant of the family was out for the afternoon. Brought thus suddenly face to face with Mrs Vallance, George was for a moment taken somewhat aback, but in the next he felt almost certain that he was recognised. A quick, slightly startled, half-doubtful look came into Mrs Vallance's face.

'Mrs Vallance,' he said, 'do you know an old friend?' His voice confirmed her recognition.

'You are—George Herder,' she answered in a low voice, which, despite the effort made to control it, trembled. She led him into a little sitting-room.

'You knew me again very quickly, Mrs Vallance,' George began in a rather hurried manner; 'as

quickly as I did you. I saw you the other night at Mrs Norcott's.

'Were you there? How did I never see you?' Her voice was still not very firm.

'Easily enough; I was with Fred Hammond. We did not stay long, and I kept a good deal in the background, for I knew no one. I did not see you till just before we left, while you were playing.'

The meeting might have seemed to a casual onlooker a very ordinary one, and to one of an emotional nature, who was aware of nothing further than that the two were old friends, less cordial than the occasion warranted. But Herder was an undemonstrative man, not through sluggishness, but through shyness of temperament; and Kate Vallance's life had been such as had tended to subdue in her the outward expression of emotion. George Herder narrated to his listener the chief events of his colonial life; and Kate related her history since the two had parted. And thus it was that, with old memories, waked to new life, stirring in the heart of each, the two met and talked with scarcely the expressed warmth of old friends. By-and-by, Katy Vallance, returning from afternoon school, entered the room, and was introduced to the stranger.

'You will stay to tea with us, Mr Herder, will you not, and wait till John comes back?' Mrs Vallance said; and George consented, although he was due at his aunt's to six-o'clock dinner.

John Vallance's sport improved as the day wore on, and he lingered late by the river. His mother and sister, with George Herder, were standing in the verandah of their cottage, awaiting his return, and John saw, as he drew near the house, the third figure of the party. The sight somewhat surprised him, for visitors of the male sex were not frequent at the cottage; but his surprise was increased tenfold when he made out the figure and face of his friend of the morning.

'John,' said Mrs Vallance, when her son had approached, 'this is an old friend of mine, who tells me that you and he have already met. He is the nephew of Miss Field, and went to Australia many years ago, as you have heard her tell. His coming back has taken us all by surprise.'

'Why, when I mentioned Miss Field's name this morning you never said anything!' said John.

'No; I must ask your pardon for that little deception,' said Herder with a smile. 'I was not sure at the time that we should meet again so soon.'

There seemed to John Vallance to be not a little mystery about the stranger, but he was content to leave events to explain themselves. Herder staid a short time after tea at the cottage, and then took his leave. A day or two after, he was there again with his aunt. George found himself lingering in Plymouth far longer than he had intended. His aunt pressed him to extend his visit, and he fell in very readily with her wish. Soon John Vallance and his sister became accustomed to the sight of Herder's brown beard, and kindly, sun-bronzed face, at their home, and the friendship between George and the young people grew and ripened.

Herder had been more than a month at Plymouth, when one afternoon he made his way to the Vallances' cottage with a fixed purpose in his mind. He found Mrs Vallance sitting alone in the little garden in front of the house. George

came direct to the matter. 'Kate,' he said quietly, but not without a tremor in his voice, 'I don't know whether I can offer you the same sort of love as I did long ago. I suppose a young fellow's love is necessarily somewhat different from that of a middle-aged man's, but I can promise the true affection of one who has not thought of any other woman since he gave up hope of you. Can you accept it? I am going to London to-morrow, to write and arrange matters with my business men in Australia. I have staid in England about as long as I had intended. Am I to return to my bush-life, or to remain here for good? It depends upon you.'

Kate Vallance placed her hand in Herder's. 'Then I think we should all like your to stay, George,' she said.

It was but a few minutes after this that John and Katy Vallance returned from an afternoon's walk.

'John,' said Herder, with his hand on the boy's shoulder, 'step-fathers are not always represented as popular people, either in books or in real life. But supposing I were to become yours would we be the worse friends, think you?'

'No, sir; I think not,' answered John with simple heartiness: 'I have never known a father, and I will gladly take you for one.'

'And Katy,' continued Herder, turning to the girl, and drawing her to his side, 'I know you will say the same as John.'

Next morning, Herder was in London, and in the evening of the same day found himself at Hammond's lodgings. Fred listened to his friend's brief statement with a quiet smile. When it was finished, he said: 'A month ago, you remember, I asked you how your little story was to end, and you gave me but a doubtful answer. I had my own thoughts at the time, though I did not venture on prophecy. You have answered me now in the most satisfactory way. I congratulate you, George, most heartily; and all I ask is, that you let me be your "best-man."'

#### THE ALLEGED DEGENERATION OF MAN.

SOME recent athletic feats, particularly that of Captain Webb, in swimming across the Channel from Dover to Calais, have drawn attention to the important fact, that physical strength, so far from degenerating with the progress of civilisation and luxury, is absolutely increasing and becoming more effective. On this subject, which is well worth discussing, the *Spectator* newspaper has the following very interesting remarks.

'There never was a delusion with less evidence for it, except a permanent impression among mankind, which is often the result, not of accumulated experience, but of an ever-renewing discontent with the actual state of things. There is not the slightest evidence anywhere that man was ever bigger, stronger, swifter, or more enduring under the same conditions of food and climate than he is now. As to bigness, the evidence is positive. Modern Egyptians are as big as the mummies who were conquerors in their day, and modern Englishmen are bigger. There are not in existence a thousand coats of armour which an English regiment could put on. Very few moderns can use ancient swords, because the hilts are too small for their hands. Endless wealth and skill

were expended in picking gladiators, and there is no evidence that a man among them was as big or as strong as Shaw. No skeleton, no statue, no picture indicates that men in general were ever bigger. The Jews of to-day are as large as they were in Egypt, or larger. The people of the Romagna have all the bearing and more than the size of the Roman soldiery. No feat is recorded as usual with Greek athletes which English acrobats could not perform now. There is no naked savage tribe which naked Cornishmen or Yorkshiremen could not strangle. No race exists of which a thousand men similarly armed would defeat an English, or German, or Russian regiment of equal numbers. Nothing is recorded of our forefathers here in England which Englishmen could not do, unless it be some feats of archery, which were the result of a long training of the eye continued for generations. The most civilised and luxurious family that ever existed, the European Royal caste, is physically as big, as healthy, and as powerful as any people of whom we have any account that science can accept. Thiers' Frenchman is Cæsar's Gaul in all bodily conditions, and with an increased power of keeping alive, which may be partly owing to improved conditions of living, but is probably owing still more to developed vitality. There is no evidence that even the feeble races are feebler than they became after their first acclimatisation. The Bengalee was what we know him twelve hundred years ago, and the Chinaman was represented on porcelain just as he is now before the birth of Christ. No race ever multiplied like the Anglo-Saxon, which has had no advantage of climate, and till lately no particular advantage of food. Physical condition depends on physical conditions, and why should a race better fed, better clothed, and better housed than it ever was before degenerate? Because it eats corn instead of berries? Compare the Californian and the Digger Indian. Because it wears clothes? The wearing of clothes, if burdensome—which the experience of army doctors in India as to the best costume for marching makes excessively doubtful, they declaring unanimously that breechless men suffer from varicose veins as men wearing trousers do not—must operate as a permanent physical training. You carry weight habitually. Because they keep indoors? Compare English professionals with Tasmanian savages, living in identically the same climate, but living out of doors. The conditions of civilisation not only do not prohibit Captain Webb, who would have out-walked, out-swum, or strangled any German that Tacitus ever romanced about, but they enable him to live to seventy instead of dying at forty-five, as two thousand years ago he, then probably a slave bred for the arena, would have done. That races have degenerated in what we may call the physical-moral qualities is incontestable, or, at least, having the fear of the Duke of Argyll before our eyes, we will not contest it—though we do not believe the Greek Klept to be the inferior of the Spartan in courage, or the men who defended Bhurtpore to be more timorous than the men who were defeated with Porus—but of physical degeneracy without change of food or climate we can find no authentic trace. The illusion is a mere result of discontent, and of inability to see facts through the mist in which time kindly enshrouds them. That the human race, even

under the best conditions, advances very little in physical capacities, is true, but then it is true also that those conditions are fatal to the most powerful of the old improving forces, the survival of the fittest. Still an advance is perceptible in vital power, and we question whether a Greek swimmer would ever have crossed from Dover to Calais, just as strongly as we question whether the ancient world ever possessed a horse which would have achieved a place at Epsom. Why should men grow feeble in civilisation any more than horses?'

#### THE MISSING SHIP.

Bright gallantly, that morning hour,  
From harbour she sailed forth;  
Five hundred sunny hearts on board,  
A thousand bales of worth—

A little kingdom on the sea,  
A little heaven of hopes,  
And whistled merrily the winds,  
And seaman at the ropes.

Oh, what a picture-gallery  
Was in those wooden walls!  
Each man was painting out his dream  
Of woods and waterfalls;

Of corn-fields bowing to the sun;  
Of kine on sweet green-sward:  
These were to be, across the sea,  
And he of all, the lord!

No wonder 'twas, though hard to part  
From all beloved of yore,  
That such a shout rang from the ship,  
And such a shout from shore!

They went. They're gone from mortal ken,  
(God only knoweth where;  
Full many a fathom deep, perchance,  
Each with his dream so fair.

Not one shall ever come to tell  
Of how and when they died:  
If thirsting in a burning calm,  
Or whelmed beneath the tide:

If storm, or rock, or horrid fire,  
The fatal havoc made:  
If some went mad, if some blasphemed,  
If some embraced and prayed.

'Tis many a day since died our hopes;  
Long since they left our coast:  
God pity them as we do! Then  
None should be mourned as lost.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

*Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.*

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.  
Also sold by all Booksellers.

### PARTRIDGES.

My own territory is not extensive; but my friend the 'squire' is very glad to see me trudging about his farms whenever I am so inclined. Richard, the keeper, however, is my particular friend, and a very intelligent man he is in his way. Sometimes I join him in going his rounds, and thereby I have obtained a stock of useful and original information concerning partridges and pheasants.

There is one point upon which Richard and I do not agree. He says that in the autumn, when the cold weather approaches, the parent birds separate from each other; their companionship is dissolved; and in the following 'pairing season' each chooses a mate without any regard to any former connection. But I cannot agree with Richard in this particular, and I will state my reasons for holding my own opinion. Rooks are known to occupy the same nest for several years in succession, an arrangement which would certainly lead to serious misunderstanding, and no little fighting, if they were not tenanted by the same couples. Swallows, after six months' sojourn in Africa, will come back, and occupy the nests they built the year before, beneath the eaves of your house. Ravens, magpies, and the generality of solitary birds, are known to keep up their association throughout the winter, and continue their connubial state until one or both fall victims to the gun, or otherwise die. I remember to have seen a partridge sitting on her eggs in a meadow not more than fifty yards from a tolerably well-frequented garden. In that situation she would remain perfectly quiet, though several persons went to look at her in the course of the day. She would also take the food that was thrown to her, without manifesting any signs of fear. The male bird was much more shy, and would not remain in sight if he were watched. The following season they took up their dwelling on the same spot, but, for some reason, they were rather late in bringing out their brood; and before

that event took place, it was found necessary to mow the grass. However, a certain portion was left for the birds' convenience; and soon after the young ones were hatched, they all disappeared together; and the following year we saw nothing of them. I have a strong notion, however, that for the two years they were the same pair of birds.

My argument, I acknowledge, has not as yet convinced my friend Richard. He maintains, on the contrary, that in the month of February or March it is as good as a play to see them go through a variety of antics with a view to pairing. I do not deny this for a moment, but I consider that these may be the last year's birds, which are mating for the first time. Nor do I say that the anticipation of spring may not have an influence on the older birds, so as to make them exhibit a renewal of their earlier frolics. Though they mate thus early in the year, it is not until towards the month of May that they begin to make preparation for a future brood of young ones. I may here remark that amongst partridges there is something peculiar, and perhaps amusing. The number of male birds is greater than that of the hens, consequently, they cannot all be suitably accommodated with mates. Some of them are destined to pass a season, at least, in a state of bachelordom. At the beginning of the period of incubation, these unfortunate ones may be heard to utter a peculiar note in the evening twilight, which experienced keepers say is a bemoaning of their unhappy lot, or a late and desperate appeal to any disengaged lady partridge to take pity upon them.

It can scarcely be said that they build any nest at all. They often take up their position on a tuft of grass in the open field, but occasionally they will exercise more discretion, and select a really secluded spot in the hedge-bottom, or amidst the thicket of a whin-bush, where the hen lays from twelve to twenty eggs. It is at this time that we, by careful observation, may become aware of the many dangers and enemies by which the partridge is beset, and when duly considered, it is surprising that so many come to maturity. The hedgehog, if once he discovers the spot where the partridge's

eggs are laid, will watch for hours for an opportunity of pilfering the poor bird's store. At last, when its patience is exhausted, and relying on its defensive armour, it will boldly attack the hen, drive her from the nest, and feast on the eggs. The stoat, the weasel, and the rat are often most destructive, if they have but a chance; and the keepers, not having faith in the doctrine propounded by the late Mr Waterton about the balance of nature, shew no mercy to such 'vermin,' whenever they come in their way. A host of birds may be reckoned amongst the enemies of the partridge. The carrion crow and the raven are well known to be constantly ready to make a raid on a nest of eggs. Even the rook—whose character is none of the best, in Richard's estimation—if once it obtains a taste for such luxuries, is said to take as many as can be found. This, however, requires confirmation. Jays and magpies are particularly keen in availing themselves of the first opportunity of committing a robbery in the absence of the parent birds. According to keepers' law, not one of these creatures should live, except the rook, which, being a doubtful subject, is allowed the benefit thereof.

Few people imagine that the country is so numerously stocked with rats as it seems to be. Many of the hedgerows almost swarm with them. One day, in our rounds, we heard a peculiar squeak, as of some animal in pain.

'What's that?' I inquired.

'It's a leveret,' replied Richard; 'I should think a weasel has got hold of him.'

A slight movement amongst the turnips was sufficient to induce the keeper to take aim, and immediately after we found a large rat, which had been shot in the midst of his dainty dining.

'I killed eighteen of these gentry in that hedgerow only last week,' exclaimed Richard in disgust; 'they come out from the houses in the summer-time.'

The partridge sits very closely for three weeks and three days, when occasionally the young birds may be seen to run off before they are entirely divested of the shell. Both parent birds will defend their brood with wonderful courage; and even when surprised by man himself, they will cover the retreat of the young ones, as if altogether regardless of their own danger. It is also curious to notice, that when but a few hours old, the baby partridges disappear in a most mysterious manner, creeping beneath grass which would seem quite inadequate to afford them shelter. Often have I suddenly come upon a very young brood, when both the old and young birds would set up a great cry of alarm; but in a moment or so, they had all vanished, as it were by magic, beneath the ground. The hen partridge has the reputation of being a good mother, and it is no more than she truly deserves. She sits very closely on her eggs, and is materially assisted by the male in the defence of the young birds, in case of danger. It is therefore seldom that their eggs are taken for the purpose of

setting them under a barn-door fowl. This, however, is done in some instances, for example, when the nest is exposed to peculiar danger, and there is little chance of the brood being brought out; or where the hen has been driven away by one of its numerous enemies, and the eggs are rescued in time. Otherwise, it is considered far more profitable to let them take their natural course.

With the pheasants it is very different. The hen is not a close sitter, nor does the male bird—which unlike the partridge, has many wives—shew any regard whatever for his progeny. The keepers therefore frequently take their eggs and place them under the common fowl. As soon as they are hatched, they are taken into the woods, the mother being kept under a coop, whilst the chicks have comparative liberty.

'I've a nice lot of young birds, sir, in the cover there,' said Richard—'if you can manage to get through the hedge,' he added.

Surmounting the obstacle without any particular difficulty, we entered the wood. The hens repeatedly poked their heads through the bars of their coops, as if they fully understood for what purpose the keeper had come; but the young pheasants were not to be seen. The keeper whistled repeatedly in a low soft key for some time, perhaps for four or five minutes, when, in a weird-like manner, the young birds came silently from the thickets. They did not follow one another, but each seemed to converge individually from its own special hiding-place. It reminded me of Roderick Dhu's warriors that appeared so mysteriously when summoned by their leader.

'You see,' said Richard, 'these birds are rather late; they all look like hens; but I've another lot, which I'll shew you by-and-by, that are beginning to shew better plumage.'

They manifested no signs of fear, but took their food with as much unconcern as though they had been domestic chickens. I expressed a hint that it seemed almost cruel to shoot the creatures at some future day, after having been made pets of for so long a time.

'That's just what the squire says,' replied Richard; 'but, bless you, sir, we shan't know 'em when they get away; and besides, if they had been young ducks or chicks they'd have had their heads chopped off or their necks twisted; and I'm sure it's far better, and more sportsman-like for 'em to be shot handsome and done with.'

Richard evidently was of the same opinion with the old general who declared of soldiers: 'Few die a death less painful, none a more honourable one.'

When the harvest has begun, especially if it be early, and some weeks have to elapse before the first of September, the keepers have a busy time. They ought frequently to be in the fields during the process of 'cutting,' to see that the birds are not frightened more than is absolutely necessary, and thus rendered wild and difficult to approach. If the harvest is late, and much corn is left

standing, the birds, especially in cold or windy weather, will lie close, to the great annoyance of the sportsman. Both the numbers and condition of the birds are considerably affected by the weather; a cold, wet spring is not favourable, but a genial atmosphere, as may be expected, will produce fine coveys. I have counted nineteen birds, all strong and active, which had been reared by one pair. Thirteen or fifteen are not to be considered at all extraordinary as to numbers, though some, of course, are less, from various accidents.

'Ah! sir,' says Richard, 'but partridge-shooting isn't what it was. It was bonny sport in my young days. Gentlemen then wasn't above walking through the stubble in the early part of the day. We knew nothing about "beaters" in them times. To be sure, the stubble was longer then than it is now. Them new mowing-machines don't leave behind 'em enough to shelter a cock-sparrow. It's many a hundred brace of birds as I've seen brought down, particularly when the corn was in stook. 'Twas a pretty sight to see a brace o' good setters or pointers at work; but, bless you, sir, they are of little use now. It's only retrievers as are thought anything of. Once upon a time,' continued the keeper, 'it was considered no bad thing if a gentleman had five hundred acres of well-stocked land to shoot over. It made a good long day for himself and a friend or two. But it's all altered now. What with "driving in," and "walking down," and breech-loaders, gentlemen have nought to do but "blaze away" as hard as they can for a few hours, with precious little trouble to themselves; and the next morning they read their own names in the papers, and the "heads" of game they killed—as though killing was the great object of a sportsman—which it oughtn't to be, sir.'

Doubtless, there is a considerable amount of truth in Richard's opinion.

## THE FLAG OF DISTRESS.

### CHAPTER XXX.—THE LAST LOOK.

'UP anchor!' The order rings along the deck of the *Crusader*, and the men of the watch stand by the windlass to execute it.

That same morning, Crozier and Cadwallader, turning out of their cots, heard with surprise the order for sending up the 'Blue-Peter,' as also that the ship was to weigh anchor by twelve o'clock noon. Of course, they were expecting it, but not so soon. However, the arrival of the corvette explains it, an officer from the latter vessel having already come on board the *Crusader* with despatches from the flag-ship of the Pacific squadron.

These contain orders for the frigate to set sail for the Sandwich Islands without any delay; the corvette to replace her on the San Francisco station. The despatch-bearer has also brought a mail; and the *Crusader's* people get letters—home-news, welcome to those who have been long away from their native land; for the frigate has been three years cruising in the South Sea. Something more than mere news several of her officers receive. In large envelopes, addressed to them, and bearing the British Admiralty seal, are documents of

peculiar interest—commissions giving them promotion. Among the rest, one reaches Crozier, advancing him a step in rank. His ability as an officer has been reported at headquarters; as also his gallant conduct in having saved a sailor's life, rescued him from drowning—that sailor Harry Blew. In all probability, this has obtained him his promotion; but whatever the cause, he will leave San Francisco a lieutenant.

There are few officers, naval or military, who would not feel favoured and joyous at such an event in their lives. It has no such effect upon Edward Crozier. On the contrary, as the white canvas is being spread above his head, there is a black shadow upon his brow, while that of Cadwallader is also clouded. It is not from any regret at leaving California; but leaving it under circumstances that painfully impress them. The occurrences of the day before, but more those of the night, have revealed a state of things that suggest unpleasant reflections, especially to Crozier. He cannot cast out of his mind the sinister impression made upon it by the discovery that Don Francisco de Lara—his rival for the hand of Carmen Montijo—is no other than the notorious 'Frank Lara,' of whom he had frequently heard—the keeper of a Monté table in the saloon El Dorado! Now he knows it, and the knowledge afflicts him, to the laceration of his heart. No wonder at the formality of that letter which he addresses to Don Gregorio, or the insinuation conveyed by it. Nor strange the cold compliments with which it was concluded; far stranger had they been warm. Among other unpleasant thoughts which the young officers have, on being so soon summoned away, is that of leaving matters unsettled with Messrs De Lara and Calderon. Not that they have any longer either design or desire to stand before such cut-throats in a duel, nor any shame in shunning it. Their last encounter with the scoundrels would absolve them from all stigma, or disgrace in refusing to fight them—even were there time and opportunity. So, they need have no fear that their honour will suffer, or that any one will apply to them the opprobrious epithet—*lèche*. Indeed, they have not, and their only regret is at not being able to spend another hour in San Francisco, in order that they might look up the intending assassins, and give them into the custody of the police. But then that would lead to a difficulty that had better be avoided—the necessity of leaving their ship, and staying to prosecute a criminal action in courts where the guilty criminal is quite as likely to be favoured as the innocent prosecutor. It is not, to be thought of, and long before the *Crusader's* anchor is lifted, they cease thinking of it.

Crozier's last act before leaving port is to write that letter to Don Gregorio; Cadwallader's to carry it ashore, and deliver it to Harry Blew. Then, in less than twenty minutes after the midshipman regains footing on the frigate's deck, the order is issued for her sails to be sheeted home, the canvas hanging corrugated from her yards is drawn taut,

the anchor hauled apeak, and the huge leviathan, obedient to her helm, held in strong hands, is brought round, with head towards the Golden Gate. The wind catches her spread sails, bellies them out, and in five minutes more, with the British flag floating proudly over her taffrail, she passes out of the harbour; leaving many a vessel behind, whose captains, for the want of a crew, bewail their inability to follow her.

But there are eyes following her, from farther off—beautiful eyes, that express sadness of a different kind, and from a different cause. Carmen Montijo and Inez Alvarez again stand upon the azotea, glasses in hand. Instead, there should have been kerchiefs—white kerchiefs—waving adieu. And there would have been, but for those chilling words: 'Parting compliments to the señoritas.' Strange last words for lovers! *Santis-sima!* what could it mean? So reflect they to whom they were sent, as they stand in saddened attitude, watching the war-ship, and straining their eyes upon her, till rounding Telegraph Hill she disappears from their sight.

Equally sad are two young officers on the departing ship. They too stand with glasses in hand levelled upon the house of Don Gregorio Montijo. They can see, as once before, two heads over the parapet, and, as before, recognise them; but not as before, or with the same feelings, do they regard them. All is changed now, everything doubtful and indefinite, where it might be supposed everything had been satisfactorily arranged. But it has not—especially in the estimation of Crozier; whose dissatisfaction is shewn in a soliloquy to which he gives utterance, as Telegraph Hill, interfering with his field of view, causes him to lay aside his telescope.

'Carmen Montijo!' he exclaims, crushing the telescope to its shortest, and returning it to its case. 'To think of a "sport"—a common gambler—even having acquaintance with her—far less presuming to make love to her!'

'More than gamblers—both of them,' adds Cadwallader by his side. 'Robbers—murderers—anything if they only had the chance.'

'Ay, true, Will; everything vile and vulgar. Don't it make you mad to think of it?'

'No, not mad. That isn't the feeling I have; but fear.'

'Fear! Of what?'

'That the scoundrels may do some harm to our girls. As we know now, they're up to anything. Since they don't stick at assassination, they won't at abduction. I hope your letter to Don Gregorio may open his eyes about them, and put him on his guard. Inez! who's to protect her? I'd give all I have in the world to be sure of her getting safely embarked in that Chilean ship. Once there, dear old Harry will take care of her—of them both.'

Cadwallader's words seem strangely to affect his companion, changing the expression upon his countenance. It is still shadowed, but the cloud

is of a different kind. From anger, it has altered to anxiety!

'You've struck a chord, Will, that, while not soothing the old pain, gives me a new one. I wasn't thinking of that; my thoughts were all occupied with the other trouble—you understand?'

'I do; at the same time, I think you make too much of the other trouble, as you term it. I confess it troubles me too, a little; though, perhaps, not so much as it does you. And luckily less, the more I reflect on it. After all, there don't seem so much to be bothered about. As you know, Ned, it's a common thing among Spanish Americans—whose customs are altogether unlike our own—to have gamblers going into their best society. Besides, I can tell you something that may comfort you a little—a bit of information I had from Inez, as we were *platicando* along the road on our ride. It was natural she should speak about the sky-blue fellow, and my sticking his horse in the hip.'

'What did she say?' asks Crozier, with newly awakened interest.

'That he was a gentleman by birth; but falling fast, and indeed quite down.'

'And De Lara: did she say aught of him?'

'She did; she spoke of him still more disparagingly, though knowing him less. She said he had been introduced to them by the other, and they were accustomed to meet him on occasions. But of late they had learned more of him; and learning this, her aunt—your Carmen—had become very desirous of cutting his acquaintance, as indeed all of them. That they intended doing it—even if they had remained in California. But now—now that they were leaving it, they did not like to humiliate him by giving him the *congé* he deserved.'

Crozier, with eyes earnestly fixed upon Cadwallader, has listened to the explanation. At its close, he cries out, grasping his comrade's hand: 'Will! you've lifted a load from my heart. I now see daylight where all seemed darkness; and beholding yonder hill, feel the truth of Campbell's splendid lines:

A kiss can consecrate the ground,  
Where mated hearts are mutual bound;  
The spot, where love's first links are wound,  
That ne'er are riven,  
Is hallowed down to Earth's profound,  
And up to Heaven!

After repeating the poet's passionate words, Crozier stands gazing on a spot so consecrated to him—the summit of the hill—where, just twenty-four hours ago, he spoke love's last appeal to Carmen Montijo. For the *Crusader* has passed out through the Golden Gate, and is now beating down the coast of the Pacific. Cadwallader's eyes, with equal interest, are turned upon the same spot, and for some time both are silent, absorbed in sweet reflection; recalling all that occurred in a scene whose slightest incident neither can ever forget. Only when the land looms low, and the outlines of the San Bruno Mountains begin to blend with the purpling sky, does shadow again loom on the countenances of the young officers. But now it is different, no longer expressing chagrin, nor the rancour of jealousy; but doubt, apprehension, fear, for the

dear ones left behind. Still the cloud has a silver lining, and that is—Harry Blew.

#### CHAPTER XXXI.—A SOLEMN COMPACT.

A cottage of the old Californian kind—in other words, a *rancho*; one of the humblest of these humble dwellings—the homes of the Spanish-American poor. It is a mere hut, thatched with a species of sea-shore grass, the 'broom-bent' seen growing in the *medanos* (sand-dunes) near by. For it is by the sea, or within sight of it; itself inconspicuous by reason of rugged rocks, that cluster around and soar up behind, forming a background in keeping with the rude architectural style of the dwelling. From the land-side it is approachable by devious and difficult paths, only known to a few intimate friends of its owner.

From the sea, equally difficult, for the little cove leading up to it would not have depth sufficient to permit the passage of a boat, but for a tiny stream trickling seaward, which has furrowed out a channel in the sand. That by this boats can enter the cove, is evident from one being seen moored near its inner end, in front of, and not far from the hovel. As it is a craft of the kind generally used by Californian fishermen—more especially those who hunt the fur-seal—it may be deduced, that the owner of the hut is a seal-hunter.

This is his profession reputedly; though there are some who ascribe to him callings of a different kind; among others, insinuating, that he occasionally does business as a *contrabandista*.

Whether true or not, Rafael Rocas—for he is the owner of the hut—is not the man to trouble himself about denying it. He would scarce consider smuggling an aspersion on his character; and indeed, under old Mexican administration, it would have been but slight blame or shame to him. And not such a great deal either under the new, at the time of which we write, but perhaps even less. Compared with other crimes then rife in California, contrabandism might almost be reckoned an honest calling.

But Rafael Rocas has a repute for doings of a yet darker kind. With those slightly acquainted with him, it is only suspicion; but a few of his more intimate associates can say for certain, that he is not disinclined to a stroke either of road-robbery, or a job at house-breaking; so that, if times have changed for the worse, he has not needed any change to keep pace with them.

It is the day on which the *Crusader* sailed from San Francisco Bay, and he is in his hut; not alone, but in the company of three men, in personal appearance altogether unlike himself. While he wears the common garb of a Californian fisherman—loose pea-coat of coarse canvas, rough water-boots, and seal-skin cap—they are attired in costly stuffs—cloaks of finest broadcloth, *jaquetas* of rich velvet, and calzoneras, lashed with gold-lace, and gleaming with constellations of buttons.

Notwithstanding the showy magnificence of his guests, the seal-hunter, smuggler, or whatever he may be, does not appear to treat them with any obsequious deference. On the contrary, he is engaged with them in familiar converse, and, by his tone and gestures, shewing that he feels himself quite their equal.

Two of the individuals thus oddly consorting

are already well known to the reader—the third but slightly. The former are Francisco de Lara and Faustino Calderon; the latter is Don Manuel Diaz, famed for his fighting-cocks. The first two have just entered under Rocas' roof, finding the cock-fighter already there, as De Lara predicted.

After welcoming his newly arrived guests in Spanish-American fashion, placing his house at their disposal—'*Mia casa a la disposicion de Vms*'—the seal-hunter has set before them a bottle of his best liquor—this being *aguardiente* of Tequila. They have taken off their outer apparel—cloaks and hats—and are seated around a small deal table, the only one the shanty contains—its furniture being of the most primitive kind.

Some conversation of a desultory nature has passed between them, and they have now entered on a subject more interesting and particular, the key-note having been struck by De Lara. He opens by asking a question:

'Caballeros! do you want to be rich?'

All three laugh while simultaneously answering: '*Carramba!* Yes.'

Diaz adds: 'I've heard many an idle interrogatory; but never, in all my life, one so superfluous as yours; not even when there's twenty to one offered against a staggering cock.'

Rocas inquires: 'What do ye call rich, Don Francisco?'

'Well,' responds the Monté dealer, 'say sixty thousand dollars. I suppose you'd consider that sufficient to bestow the title?'

'Certainly; not only the title, but the substantial and real thing. If I'd only the half of it, I'd give up chasing seals.'

'And I cock-fighting,' put in Diaz; 'that is, so far as to look to it for a living; though I might still fight a main for pastime's sake. With sixty thousand dollars at my back, I'd go for being a grand ganadero, like friend Faustino here, whose horses and horned cattle yield him such a handsome income.'

The other three laugh at this, since it is known to all of them that the ganadero has long since got rid of his horses and horned cattle.

'Well, gentlemen,' says De Lara, after this bit of preliminary skirmishing, 'I can promise each of you the sum I speak of, if you're willing to go in with me in a little affair I've fixed upon. Are you the men for it?'

'Your second question is more sensible than the first, though equally uncalled for, at least so far as concerns me. I'm the man to go in for anything which promises to make me the owner of sixty thousand dollars.'

It is Diaz who thus unconditionally declares himself. The seal-hunter endorses it by a declaration of like daring nature. Calderon simply nods assent, but in a knowing manner. He is supposed to be already acquainted with De Lara's design.

'Now, Don Francisco! let's know what you're driving at?' demands Diaz, adding: 'Have you struck a *veta*, or discovered a rich *placer*? If so, we're ready for either rock-mining or pan-washing, so long as the labour's not too hard. Speak out, and tell us what it is. The thought of clutching such a pretty prize makes a man impatient.'

'Well, I'll let you into the secret so far—it is a *veta*—a grand gold mine—but one that will

need neither rock-crushing nor mud-cradling. The gold has been already gathered; and lies in a certain place, all in a lump; only waiting transport to some other place, which we may select at our leisure.'

'Your words sound well,' remarks Don Manuel.

'Wonderful well,' echoes Rocas.

'Are they not too good to be true?' asks Diaz.

'No. They're true as good. Not a bit of exaggeration, I assure you. The gold only wants to be got at, and then to be taken.'

'Ah! there may be some difficulty about that?' rejoins the doubting Diaz.

'Do you expect to finger sixty thousand pesos, without taking the trouble to stretch out your hand?'

'O no. I'm not so unreasonable. For that I'd be willing to stretch out both hands, with a knife in one and a pistol in the other.'

'Well, it's not likely to need either, if skilfully managed. I ask you again, are you the men to go in for it?'

'I'm one,' answers Diaz.

'And I another,' growls Rocas, whose manner tells that he already knows what the Monté-dealer means.

'I'm not going to say no,' assents Calderon, glancing sympathetically at the questioner.

'Enough!' says De Lara; 'so far as you consent to the partnership. But before entering fully into it, it will be necessary to have a more thorough understanding, as also a more formal one. Are you willing to be bound that there shall be truth between us?'

'We are!' is the simultaneous response of all three.

'And fidelity to the death?'

'To the death!'

'Bueno! But we must take an oath to that effect. After that, you shall know what it's for. Enough now to say it's a thing that needs swearing upon. If there's to be treason, there shall be perjury also. Are you ready to take the oath?'

They signify assent unanimously.

'To your feet, then!' commands the chief conspirator. 'It will be more seemly to take it standing.'

All four spring up from their chairs, and stand facing the table. De Lara draws a dagger and lays it down before him. The others have their stiletos too—a weapon carried by most Spanish Californians. Each exhibits his own, laying it beside that already on the table. With the four De Lara forms a cross—Maltese fashion—and then standing erect, Diaz opposite, Rocas and Calderon on either flank—he repeats in firm, solemn voice, the others after him:

*'In the deed we this day agree to do, acting together and jointly, we swear to be true to each other—to stand by one another, if need be, to the death; to keep what we do a secret from all the world; and if any one betray it, the other three swear to follow him wherever he may flee, seek him wherever he may shelter himself, and take vengeance upon him by taking his life. If any of us fail in this oath, may we be accursed ever after!'*

This infamous ceremony duly ratified, a drink of the fiery spirit of the mezcal plant is a fit finale; which quaffed, they take up their stiletos, replace them in their sheaths, and again sitting down, listen to De Lara, to learn from him the

nature of that deed for doing which they have so solemnly compacted.

In a short time he makes it known in all its details, the disclosure calling for but a few words. It is after all but a common affair, though one that needs skill and courage. It is simply a 'bit of burglary,' but a big thing of its kind. He tells them of between two and three hundred thousand dollars' worth of gold-dust lying in a lone country-house, with no other protection than that of its owner, a feeble old man, with some half-score of Indian domestics.

There are but two of them to whom this is news—Diaz and Calderon. Rocas smiles while the revelation is being made; for he has been the original depository of the secret. It was that he communicated to De Lara, when on the day before he stopped him and Calderon at the tinacal of Dolores. It is not the first time for the seal-hunter to do business of a similar kind in conjunction with the gambler; who, like himself, has been accustomed to vary his professional pursuits. But as now, he has always acted under De Lara—whose clear, cool head and daring hand assure him leadership in any scheme requiring superior intelligence for its execution.

'How soon?' asks Diaz, after all has been declared. 'I should say the sooner the better.'

'You're right about that, Don Manuel,' rejoins Rocas.

'True,' assents De Lara. 'At the same time, caution must not be lost sight of. There's two of you know what danger we'd be in if we went near the town, or anywhere outside this snug little asylum of Señor Rocas, whose hospitality we may have to trench upon for some time. I don't know, Don Rafael, whether friend Diaz has told you of what happened last night?'

'He's given me a hint of it,' gruffly replies the smuggler.

'O yes,' puts in Diaz; 'I thought he might as well know.'

'Of course,' agrees De Lara. 'In that case, then, I've only to add that there will be no safety for us in San Francisco so long as the English man-o-war stays in port. He who broke our bank is rich enough to buy law, and can set its hounds after us by night, as by day. Until he and his ship are gone!—'

'The ship is gone,' says Rocas, interrupting.

'Ha! what makes you say that?'

'Because I know it.'

'How?'

'Simply by having seen her. Nothing like the eyes to give one assurance about anything—with a bit of glass to assist them. Through that thing up there—he points to an old telescope resting on hooks against the wall—'I saw the English frigate beating out by the Farralones when I was up on the cliff about an hour ago. I knew her from having seen her lying out in the bay. She's gone to sea, for sure.'

At this the others look surprised, as well as pleased; more especially Calderon. He need no longer fear encountering the much-dreaded midshipman, either in a duel or with his dirk.

'It's very strange,' says De Lara. 'I'd heard the Crusader was to sail soon, but not till another ship came to relieve her.'

'That ship has come,' returns Rocas—'a corvette. I saw her working up the coast last

evening, just before sunset. She was making for the Gate, and must be inside now.'

'If all this be true,' says the chief conspirator, 'we need lose no more time, but put on our masks, and bring the affair off at once. It's too late for doing anything to-night; but there's no reason why we shouldn't act to-morrow night, if it prove a dark one. We, four of us, will be strength enough for such a trifling affair. I thought of bringing Juan Lopez, our coöper, but I saw he wouldn't be needed. Besides, from the way he's been behaving lately, I've lost confidence in him. Another reason for leaving him out will be understood by all of you. In a matter of this kind, it isn't the more the merrier, though it is the fewer the better cheer. The yellow dust will divide bigger among four than five.'

'It will,' exclaims the cock-fighter with emphasis, shewing his satisfaction at what De Lara has done. He adds: 'To-morrow night, then, we are to act?'

'Yes, if it be a dark one. If not, 'twill be wiser to let things lie over for the next. A day can't make much difference; while the colour of the night may. A moonlit sky, or a clear starry one, might get us all where we'd see stars without any being visible—with a rope round our necks.'

'There'll be no moon to-morrow night,' puts in the smuggler, who, in this branch of his varied vocations, has been accustomed to take account of such things. 'At least,' he adds, 'none that will do us any harm. The fog's sure to be on before midnight; at this time of year, it always is. To-morrow night will be like the last—black as a pot of pitch.'

'True,' says De Lara, as a man of the sea, also having some slight meteorological knowledge. 'No doubt, 'twill be as you say, Rocas. In that case, we have nothing to fear. We can have the job done, and be back here before morning. Ah! then seated round this table, we'll not be like we are now—poor as rats; but every one with his pile before him—sixty thousand pesos.'

'Carramba!' exclaims Diaz, in a mocking tone, 'while saying vespers to-night, let's put in a special prayer for to-morrow night to be what Rocas says it will—black as a pot of pitch.'

The profane suggestion is hailed with a burst of ribald laughter; after which they set about preparing the *mascaras*, and other disguises, to be used in their nefarious enterprise.

residents in India, and from it are all the most direct routes to the interior of the Himálaya and Central Asia. It was here, therefore, that Mr Wilson made his final preparations for a journey which extended from Shipki, in Chinese Tibet, to the Sind valley, in Upper Kashmir, along the whole line of the Western Himálaya; not exactly over the tops of them, but through a series of elevated valleys, for the most part twelve thousand feet high, with passes ranging up to eighteen thousand feet.

The preparations for such a journey were necessarily rather formidable, especially for one who, when he started, was unable to mount a horse, or walk a hundred yards. A tent was the first necessity; and one constructed after the pattern of that used in Abyssinia by Lord Napier of Magdala was found to be by far the best that could have been procured for the purpose. In order to avoid taking a small army of coolies, the amount of provisions, tent furniture, &c. was cut down to the lowest point. In most villages, mutton, milk, and coarse flour could be procured. The need of stimulants in the highly rarefied air of the mountains is very slight, but a supply of compressed vegetables was indispensable.

The first part of the journey was along 'the Great Hindusthan and Tibet Road,' which stretches from Simla to the gloomy valley of the Sutlej. And along this road, which is in reality a mere bridle-path, running often without any parapet, and only seven or eight feet broad, across the face of enormous precipices and nearly precipitous slopes, Mr Wilson had to be carried in a *dandi*, the nearest approach to travelling in which, he says, 'is sitting in a half-reefed topsail in a storm, with the head and shoulders above the yard.' But so much do the bearers dislike this special work, that it is difficult, says our traveller, 'when the road is narrow, and the rocks are falling, and one's feet are dangling over a precipice, for the candid mind to avoid concluding they would be justified in throwing the whole concern over.' But the Narkanda Ghaut was reached at last, and here, at an elevation of nine thousand feet, a splendid view of the Sutlej valley and the snowy ranges beyond was obtained. To reach those snowy heights it was necessary first to descend into the burning valley. And Mr Wilson seems to have been haunted by a but too well-founded presentiment of evil as he did so. Yet the wonderful combinations of beauty and grandeur he met with in his path, might well compensate almost worse fears—at one moment catching a glimpse of snowy peaks rising twenty thousand feet high close above, and next minute looking down into a precipitous gorge thousands of feet deep. Green alps rising on every side, and Himálayan hamlets built on ridges of rock, or some green sloping meadow clothed with white flowers; and at every step giant trees, sometimes forty feet in circumference, waving their branches under the intense blue of the sky. It is pleasant to know that the

#### WANDERINGS IN THE HIMÁLAYA.\*

It was in the spring of 1873 that Mr Andrew Wilson—with whose writings many of our readers are doubtless familiar—started, an invalid in search of health, for the Indian hill-stations of Masúri and Simla, hoping to get a distant view of the Himálaya. But the first glimpse of the Jumnotri and Gangotri peaks 'excited longings there was no need to restrain,' and he determined to quit Simla, and place, as speedily as possible, a snowy range between himself and the Indian monsoon. Simla, purchased in 1822 from the Rana of Keonthul by the British government, has since then become the greatest sanatorium for English

\* *The Abode of Snow*. By Andrew Wilson. Blackwood & Sons.

conservancy of these cedar forests of the Sutlej is looked after by the 'Forest Department' in British India, so that the ruthless destruction which is the rule in the native states, will, we hope, be long prevented.

At Pangay, where the main road comes to an end, Mr Wilson bade adieu to civilisation, and prepared for tent-life, and fairly entered what he describes as the wildest and sublimest region of the earth. It was here he made his first acquaintance with the meaning of a granite avalanche. The whole mountain-side, including the road—or what had to serve as road—over which it was necessary to pass, was covered for a long way with huge blocks of gneiss and granite, while at one point it was necessary to wind over this rough footing, round a corner of the precipice, 'on two long poles which rested on a niche at the corner of the precipice which had to be turned, and which there met two corresponding poles from the opposite side.' A ticklish position for the most experienced traveller, but pleasant camping-ground was found near by, at a village, where there was also a Lama temple; and here and everywhere was to be seen the curious prayer-wheel, by the help of which the Lama prayer, *Oru mani pad me hanu*—which, freely translated, means, 'O God, consider the jewel in the lotus, amen'—is endlessly repeated. The journey from Lippe to Súguam was over a pass 14,354 feet high; and here, for the first time, Mr Wilson rode the yak or wild ox of Tibet. And if any one would like to have an idea of the comfort of riding this creature, he suggests he need only fasten two Prussian spiked helmets close together along the back of a great bull, and sent himself between them. Before Súguam was reached, he was compelled once more to have recourse to the *dandi*, and ultimately reached Pú (which, if our readers will take the trouble to consult a good map, they will see is on the immediate border of Chinese Tibet), more dead than alive; having been compelled to do ten miles of the distance on foot, or rather on hands and feet, along narrow ledges of slate, often with no path, but only a few hard ends of slate sticking out, and a few ropes of juniper branches to help the traveller across some frightful chasm; while it seemed to our already invalided hero as if the whole precipice had got into the habit of detaching itself in fragments into the river, which in these deep gorges foamed along at the rate of twenty miles an hour.

The 'Valley of the Shadow of Death,' as some one has not inaptly called the valley of the Sutlej, was destined to prove no pleasant halting-place. For a month Mr Wilson lay in his tent struggling with disease and misery. A Moravian missionary stationed here was absent, and his wife, a kindly, well-meaning woman, seems hardly to have been an efficient nurse; while the immediate proximity of scorpions, serpents, sandflies, and wild beasts kept the invalided man in a state of perpetual torment. With the return of the missionary, however, matters improved, and as soon as possible the

kindly German accompanied the invalid to higher ground, and together they set off for Shipki, in Chinese Tibet. In the course of that journey our attention is called to the geological formation of the rocks, and to the fact that 'across the Chinese border the mountains are rolling plains of quartz and whitish granite, probably containing great gold deposits.' Mr Wilson adduces adequate evidence to support his conclusion that important gold-fields are to be found in Chinese Tibet, the proper working of which has been effectually prevented hitherto, both by the Lama religion, and by the absence of the mechanical appliances of civilisation; but the fact itself may account in large measure for the jealous care with which foreigners are excluded from this land of mineral wealth.

The difficulties Mr Wilson himself encountered in his efforts to penetrate beyond the frontier are decidedly amusing, and serve to indicate a few of the peculiarities of the people. He had sent his servants in advance to Shipki, that they might pitch his little mountain-tent before his arrival; an undertaking which did not prove so easy as might have appeared probable. The reader must bear in mind, that Shipki is situated on the very steep slope of a hill, above a foaming river; that there is no level ground there, except the roofs of the houses, which are jealously guarded by huge Tibetan mastiffs, and the narrow terraced fields surrounded by prickly hedges on stone walls. Of course, the only apparently available spot was on one of these fields. But here a formidable obstacle presented itself, in the shape of a band of powerful, handsome, young Tartar women, who constituted themselves guardians of the ground, and shewed determined fight. In vain the Moravian missionary, who was with our traveller, argued fluently in Tibetan. His eloquence was wasted. To use force was impossible; for, to say nothing of the want of English gallantry such a proceeding would have implied, Mr Wilson very much doubts if these young Tartar women would not have proved more than a match for his handful of servants; and most certainly the men of the place would have found in any attempt 'at attack a pretext for a murderous assault. There appeared nothing for it but ignominiously to submit. But fortunately, a Lama, for whom, Mr Pagell, the missionary, had done some medical service, appeared on the spot, and offered the strangers a field of his own; on which for two nights they were permitted to encamp. But every attempt to proceed further proved unavailing. The Tibetans reasoned 'that wherever Englishmen set foot in a country, however peaceably at first, they ended by conquering it; that the only way to keep their country was to keep Englishmen out.' So without losing further time, Mr Wilson resolved to alter his route, and reach Kashnir by way of remote Tibetan provinces such as Zanskar.

Meanwhile he had heard more than enough of the cruelty of the people whose acquaintance he was so anxious to make; while some idea of their social condition may be gained from the fact that polyandry is not only tolerated, but is 'probably the common marriage custom of thirty millions of people,' being nearly universal throughout the Tibetan-speaking provinces. The people are enor-

mous eaters, and not over-particular as to the quality of their food. Ferocity is so much admired that, in order to create it, we find the people fond of eating putrid meat, and giving to infants a pap made of dried meat ground into powder and mixed with fresh blood; after which we need not be astonished to find the men strong to bear enormous burdens, and endure the long marches they are often compelled to make up and down their terrible mountains. Strong-nerved, too, to judge by the way they will cross their rivers, by means of the *jhūla* or twig bridges, made simply of two thick ropes of twigs stretched—sometimes at a considerable height over the river—a distance of from four to six feet apart, while another rope runs between them, three or four feet lower, connected with the upper ropes only by more slender twists of birch twig. It does not take a very vivid imagination to realise the sensations of the ordinary traveller who finds himself half-way across some roaring torrent, with merely a bending rope between himself and certain destruction. But then he is compensated for putting his neck in jeopardy by the sight of mountains like Lio Poryuil, which stands like a great fortress between Iran and Turan, between the dominions of the Aryan and the Tartar race, rising to a height of 22,183 feet. Its cream-coloured granite and quartz towers, walls, and aiguilles suggesting 'Milan cathedral magnified many million times.'

In the province of Lahant, through which Mr Wilson passed, he found the Moravians had created quite an oasis in the midst of the squalor and wildness of a sparse Himalayan population. They have their headquarters at Kaeleng, and their work, as Mr Wilson observes, is not to be judged by the number of their converts. They have translated almost the whole of the New Testament, and have scattered Christian publications over all the Tibetan-speaking countries, besides conducting extensive educational operations; and our readers are probably aware that, with Moravian missionaries, education includes a knowledge of agriculture, carpentry, masonry, &c.

Following the lie of the Himalaya, always in the loftier valleys, our traveller went over the great Schinkal Pass into the almost unknown province of Zanskar; and when about a day's journey from the capital—a really considerable village—he was overtaken in a snow-storm, and obliged to take refuge in a Tibetan house, into which he was admitted as a special favour. Though 'typical of Tibetan houses of the better class,' it does not seem to have been the place one would choose for a prolonged visit. The lower rooms were all occupied by ponies, sheep, and cattle, whilst the upper were partitioned off into a large room occupied by the women and children, a chapel, a store-room, and a principal apartment, which Mr Wilson shared with the husbands of the wife, and any wanderer who might drop in. A square hole in the roof admitted air, light, and snow. Smoke was expected to make its exit through this aperture, but generally declined doing so. 'Certainly the reader is not impressed with the comfort of a Tibetan residence, but Mr Wilson's detention was not of long duration. With the first abatement of the storm he proceeded on his way, and by a difficult, unusual, and by no means desirable route, at last descended to Kashmir. And here at Srinagar, the capital of the country, he rested for awhile,

the guest of the Resident, the late lamented Mr Le Poer Wynne.

The valley of Kashmir has been so often described, that its beauty and general characteristics are probably familiar to our readers. Yet much remains to be known. It must have been pleasant for the nearly worn-out traveller to find himself at last in one of the most delightful regions of the earth. In a valley six thousand feet above the sea, sixty miles long, and forty in breadth, surrounded and protected by magnificent mountains, with a temperate climate, brilliant vegetation, and a capital which, on a cursory glance, might bear comparison with Florence, it would be well, Mr Wilson suggests, if the visitor would not be disenchanted, not to venture too far into the interior; but 'some of the canals present deliciously picturesque scenes such as even Venice cannot boast.' The Sout-i-kol, or Apple-tree Canal, which connects the Dal with the Jhelam, must be magnificent, the stream covered with aquatic birds of every variety of plumage, and splendid trees rising from its lotus-fringed smooth green banks; while on the Dal itself (a lake five miles long and about half as broad) are floating gardens, curiously formed. 'The reeds, sedges, water-lilies, and other aquatic plants which grow together in tangled confusion, are, when they cluster more thickly than usual, detached from their roots; the leaves of the plants are spread over the stems, and covered with soil, on which melons and cucumbers are grown.' But still more useful to the people of Kashmir is the horned water-nut (*Trapa bispinosa*), which Mr Wilson tells us is ground into flour and made into bread; sixty thousand tons of it are said to be taken every season from the Wutlar Lake alone. Indeed, nature seems to have provided for a far larger population than at present exists in the country.

And with all this fair exterior, and these conditions for the physical well-being of the people, the inhabitants of the land are disappointing—a people filthy in their habits, cowardly and corrupt; half-starved, half-naked children, and worn-out looking women, are everywhere conspicuous. The present Maharajah seems anxious to effect reforms, and, one day in every week, holds an open court to administer justice, and on these occasions the meanest peasant is free to prefer his suit. But, practically, this nominal liberty is of small avail, owing to the system of terrorism which prevails. The famous trade in Kashmir shawls has greatly decreased. The shawl-weavers seem to get miserable wages, and are very nearly in the position of slaves, not being allowed to leave Kashmir, or change their employment. The finest of the goat's wool employed in making these shawls comes from Túrán, in the Yarkand territory. 'It is only on the wind-swept steppes of Central Asia animals are found to produce so fine a wool.' But another source of revenue is beginning to attract the attention of the government—this is the manufacture of silk. The present Chief-justice of the court of Srinagar has, we learn, made himself practically acquainted with the breeding of silk-worms and the spinning of their cocoons, and he has actually been able to induce Brahmans to allow their children to engage in spinning silk. This is an enormous step in the path of progress, as those who are acquainted with Brahmanical habits can best judge. In 1871, the Maharajah set apart thirty

thousand pounds for the development of this branch of industry. But at present the entire population of his dominions scarcely exceeds a million and a half; the beautiful valley itself containing scarcely half a million, while it could with ease support four millions, and is admirably adapted for English colonisation. As matters at present stand, however, there is little chance of many Anglo-Saxons settling there, since 'no Englishman can settle in the country, or purchase a foot of land in it,' and it is only by special permission that visitors are allowed to enter even during winter.

Not far up the Jhelam from Srinagar, the traveller comes upon the ancient capital of Kashmir, where there still exist the ruins of a Hindu temple of great antiquity, 'its roof covered with sculpture of purely classic design,' and many indications that its details were borrowed from Greek architecture; though Mr Wilson is inclined to ask if these Kashmirian ruins may not possibly have belonged to a much earlier age, and have influenced Greek architecture, instead of being influenced by it. 'At all events,' he says, 'this beautiful little temple stands alone, a curious remnant of a lost city and a bygone age.' Another great ruin which arrested the attention of our traveller was that of the once magnificent temple of Mártand, which he describes as one of the noblest amongst the architectural relics of antiquity to be found in this or any other land. There are indications that a great city may once have stood around it; but now it stands quite alone in solitary grandeur, with exquisite pillars, delicate though now half-defaced ornamentation, and with a grandeur of outline and richness of detail which the visitor finds it difficult adequately to describe. It is supposed to owe its existence to the most ancient dynasty of Kashmir. The Pandú dynasty ended twenty-five hundred years before Christ, which gives an antiquity of nearly five thousand years to the temple. This is mere conjecture, however, and it is probably of far more recent date; though Mr Wilson adduces one speculation in favour of its great antiquity, which should not be overlooked. Geology leaves no doubt that the great valley of Kashmir was once a magnificent lake; and there is considerable evidence that the temple of Mártand must have been placed where it now stands at a period 'when the inhabitants of Kashmir were located on the slopes of the mountains, round what must have been one of the most picturesque sheets of water upon earth.' 'The people were Indo-Aryans, retaining much of the simplicity and rich powerful naturalness of the Vedic period, but civilised to a high degree, and able to erect splendid temples to the sun-god.'

The people have degenerated since those days, and small traces remain of the hardiness and courage which once distinguished the Kashmiri; but it must be a pleasant land for the weary traveller to rest in awhile, and drink in scenes of quiet beauty, wandering—if such wanderings are permitted—in the 'Garden of Delight,' the Nishat Bagh, or the Golden Island, or floating up the canals, enjoying a delicious repose, before once more ascending the snowy heights and difficult passes which will bring him again into the land where he may dispose of his 'worn-out dandi, his cooking-pots, and his Khiva horse,' and glide by railway from Lahore to Bombay; 'while all across

the Country of the Five Rivers, afar off, high above the golden-dust haze, gleam the snowy summits of the giant mountains, whose whole line I have traversed in their central and loftiest valleys.'

#### A REMARKABLE DREAM.

SOME few years ago I was a resident in Hong-kong, and there became acquainted with the following circumstances. The story itself was related one winter's evening—for even in China there is a winter—around a glowing fire that put one in mind of home. The conversation during dinner had turned upon dreams, and some very curious theories were advanced in support of the interpretation of them. Our number consisted of eight persons; and after a protracted discussion, in which the number for and against there being any truth in dreams stood about equal, Captain Topham proposed to settle the question by telling us a story of what actually happened to himself a few years previously. The cloth was removed, and at the invitation of our host we each drew our chairs round the fire, lit our cigar or pipe; and after mixing for himself a glass of punch, the captain related the following tale as nearly as I can remember:

'It is now, gentlemen, some ten years ago since I was first-mate of the opium schooner *Wild Dayrell*. We were lying in Hong-kong harbour at the time, preparatory to sailing the next morning for Formosa. Then—and, for the matter of that, now—there was a great deal of smuggling done in that beautiful island of the Chinese. Our cargo consisted of thirty thousand dollars in syce, one hundred and fifty chests of Patna, and two hundred chests of Malwah opium, besides a few sundries, which could be bought cheap enough in Hong-kong or Shaug-hai, but upon which we turned a good round sum. Captain Wilkes—whom I think you all know, gentlemen—commanded her, and had made many a voyage, and run many a risk for his owners to the same place. At about four in the afternoon the captain left me to go on shore; but just as he was stepping into the boat, he cried out:

"Topham! Upon second thoughts, I shan't stay on shore to-night, as I intended. I am going to old Douglas's to dine; and as, in all probability, it will be a noisy party, I shall slip away early; so you can look for me about eleven."

"Very well, sir," I answered; and then turned to see that everything was all right for the morning.

'At six o'clock I and the second-officer had tea; and after tea, he and I had quite a confidential chat about our voyage, the value of our cargo, and the immense risk that was run in not shipping Englishmen, in place of the mongrel crew we then had. Our crew consisted, by the way, of fourteen persons, including the captain. The captain, myself, second-officer, and two sailors were Englishmen; a Lascar; two Manila men, two Malays, and two Chinamen, as seamen; a Chinese cook, and Chinese steward—in all, fourteen

souls. At about eight o'clock the second-officer had retired for the night, and had left me alone on the poop. I well remember how my thoughts then ran. I revolved in my mind the conversation that I had had with Mr Spencer, the second-officer, respecting the immense value of our cargo, and the risk that we ran, both from our own crew, should they turn traitors, and also from the hordes of pirates that continually infest the China seas, notwithstanding our gun-boats, and the havoc that they make of them whenever they come within range.

"Well, gentlemen, upon that evening my thoughts were especially turned upon home, and to a dear mother from whom I had received a letter by the last mail, and who was then in a very delicate state of health. I had answered her letter only that morning.

"I must have been on the poop about three-quarters of an hour after Mr Spencer had left me, and was thinking of returning to the cabin to look over some papers connected with the ship, when I observed a sampan, or Chinese boat, hovering round the stern. I called out to the men in the boat, and inquired what they wanted there; but their only answer, when they found they were observed, was to pull away from the ship in the direction of the middle of the harbour. Their movements I did not at all like, and leaning on the taffrail, I watched them until they were lost in the darkness. I suppose I must have remained in this position—that is, with my arms on the taffrail—about ten minutes, when, without warning, I felt myself lifted off my legs, and some one behind me endeavouring to throw me overboard. I am by no means a light weight, gentlemen, as you can see, weighing, I should say, then sixteen stone; but the person evidently depended upon the suddenness of the attack to accomplish his purpose. I struggled violently, holding on by my hands to the rail, and letting fly right and left with my feet; and in the end I was successful. The Chinaman tripped, and lay upon the deck in my power. Without a thought, without a moment's hesitation, I laid hold of him by the trousers with one hand, and took a couple of turns of his pig-tail by the other, and threw him overboard. After I had accomplished this, I made for the cuddy. Arrived there, I at once went to Mr Spencer's cabin; but upon trying the door, found it locked! I gave one or two good kicks, at the same time calling out to him to open the door. He sprang from his berth, and called out in reply that it was locked from the outside. I told him to stand clear, and with a good one, two, three, from the shoulder, I burst the door in. There is no doubt I must have looked very pale and very excited, as his first question to me was:

"Why, Mr Topham, what in the name of goodness is the matter? You look as pale as death."

"I told him all that had happened, and likewise my suspicions that we had not seen the end of the affair, and that our best plan would be at once to arm ourselves. I told him to dress himself, whilst I went on deck to rouse our two English sailors, whom we could depend upon, and bring them aft to the cabin. I had planted one foot in the saloon, the other being still in Mr Spencer's cabin, and had my eyes directed to the stairs of the companion, when, in the shade, I thought I descried a Chinaman. Thinking that it might be the

steward, I called out to him by name "A Tong;" but no reply came; when I felt pretty certain that it was not the steward; in which belief I was not long left in doubt. I had turned my head into Mr Spencer's cabin, to tell him of my suspicions, when I thought I heard steps stealthily approaching me. I gave a rapid glance; and there, not four feet from where I stood, were some five or six as villainous-looking Chinamen as I had ever beheld, armed, some with bamboos about ten feet long, and others with swords. In an instant, I had sprung into the cabin, and closed and bolted the door. With a yell, the whole of the gang made one simultaneous rush towards the door; but they had missed their mark by a second. I had planted my back against the door, and thanks to my weight and the bolts, it resisted their combined efforts to force it. Other measures, however, I knew must be at once resorted to, and that instantly. Calling upon Mr Spencer to move his chest of drawers against the door, and placing two trunks on the top of them, we patiently waited the coming events. Spencer very fortunately had a couple of Colt's revolvers in his chest of drawers, with which we armed ourselves. The gang outside were evidently in deep consultation as to their next mode of attack. One voice I heard raised above all the others, and that one voice was without a doubt A Tong, our much respected steward! From the little Chinese I was acquainted with, I gathered that they were bent upon the treasure, which had come on board from the Oriental Bank only that afternoon. It had been stowed away in the captain's cabin, and was safely lodged in one of Milner's fire and thief proof safes.

"They proceeded to the captain's cabin; but in a very short time returned, and, knocking at the door with their bamboos, demanded it to be opened. At first they used threats, then entreaties, promising us that not a hair of our heads should be hurt. But, though we feared their threats, we had no faith in their promises, and fully determined that, if the worst came to the worst, we would sell our lives dearly. Oh, how we longed for eleven o'clock, for Captain Wilkes's return! How patiently and eagerly we listened for the splash of the oars of the six stalwart boatmen! We heard four bells from the different ships in the harbour, some not a couple of hundred yards away; but it was impossible to reach or signal them. Instead of a large port-hole, there was only the small dead-light, through which we could not even manage to thrust our heads, much less our bodies. Well, sirs, when they found that neither threats nor promises would avail them, they at once commenced their work. I was standing on a camp-stool, endeavouring to see what they were doing, by looking through the iron grating on the top of the door, when I saw one of them with a spear, at what, in military phraseology, would be termed "shorten arms"—that is, with the spear drawn back to its fullest extent, ready to thrust through the door. I gave one spring from the stool, and lucky indeed I did so; for the next moment the point of a spear grazed my cheek. Another inch to the left, and I would have been a dead man. We both then retired to the further end of the cabin, so as to keep out of harm's way. We knew that they dared not use firearms, for fear of attracting the attention of the ships in the neighbourhood; and no doubt

this was our salvation. Spear after spear was thrust through, some almost reaching us as we crouched down on the floor of the cabin, when all at once we heard a crash, and, on looking up, to our horror saw that one of the panels of the door had been forced in sufficiently for a man to thrust his body through. We both immediately sprang upon our feet, grasping our revolvers more firmly, expecting that, in desperation, some of them would be hardy enough to try and force their way into the cabin. But they were far too cunning for that. Two of them now got upon chairs, but taking care to keep out of the line of fire of our revolvers, and by side-thrusts—by which they shewed that they were adepts in the use of the weapon—compelled us to kneel and crouch behind the chest of drawers one moment, into the berths the next, and, at last, under the bottom of them, where we were for some time comparatively safe. But, emboldened by their success, they now faced the broken panelling; and we could plainly see that, in another minute or two, the matter would end by our both being speared like wild boars. I whispered to Spencer to fire at the first head that shewed itself at the panelling, and I would do the same—he to take the right, and I the left, so that we should not waste ammunition through both of us firing at the same person. I remember as if it happened only five minutes ago, two heads suddenly appearing, and myself and Spencer in the act of presenting our revolvers at them, when, as a flash of lightning, two spears were suddenly thrust through the aperture, and the next instant I felt a twinge in the right side.

Here the narrator paused for a few moments, and after a good stiff pull at his punch, continued:

'I remember no more until six weeks afterwards, when I was lying in bed in a strange room, very weak and very faint. There was my servant keeping me nice and cool with a large fan, whilst on my forehead was a cloth steeped in vinegar. By degrees, some slight recollection came back to my mind of the events that had happened on that fearful night; but when I interrogated my Chinese nurse, I could only obtain from him such replies as: "Me no sabby; doctor berry angry me talkee that pigeon." By which he meant that he knew nothing about the matter; and that if he did, he was enjoined by the doctor to silence, otherwise he would be very angry with him. However, with a good constitution and careful attention, I was soon able to leave my room; and then, and not before, I gathered from my old friend, Charles Lawrence, one quiet afternoon, the following rather rambling account of the affair.

"I have no occasion," said Charley, "to ask you to remember the 8th of March, for that you will do to the end of your days; but I have also reason to remember it; for on that day, as I learned by a letter from home by the last mail, an only brother was killed on the Great Western Railway, in the collision that occurred near Reading. Well, if you remember that evening, we were to have a great spread at Douglas's. Thompson, Wilkinson, and some twenty others, were invited, including Captain Wilkes. Of course, you know what a jovial fellow Wilkes is, good for a story or song, and can take his part in an argument with the best of them. Everything went off very

well during dinner; and after the cloth had been removed, and one or two songs had been given, the call was for Wilkes. He, however, who is usually so ready and willing to oblige, made some excuse about hoarseness, which, however, was so palpably fictitious, that we all burst out laughing; and upon being pressed again by some of us, including old Douglas, he positively refused, and intimated his intention of going on board at once. We could see that something had occurred to irritate him, but for the life of us none of us could guess. Before leaving the room, however, Douglas called him to one side, and asked him the cause of his going away so early. He replied that he was uneasy in his mind; that a depression of spirits such as he had never felt before, had come over him within the last half-hour, but for which he could not account; and asked Douglas kindly not to detain him, as he wanted to go on board to see that everything was all right; and if he felt better, they might expect to see him in the course of an hour or so. And in an hour's time he did return, not to join our party, but to horrify us with the details of what had occurred on board the *Wild Dayrell*. Dr. Anderson, who was one of our party, went on board immediately, to attend to you; and Captain Wilkes and two or three of us proceeded to the police station to report the matter. The police took the matter up vigorously; and thanks to a large reward offered by the owners, one of the gang turned Queen's evidence; and in the course of three or four days the whole gang was safely lodged in the Victoria jail. They were brought up before the magistrate, and remanded until you are able to appear against them."

But I asked: "What time did Captain Wilkes arrive on board the *Wild Dayrell*; it was some time after ten o'clock—of that I am sure."

"Yes," he replied; "I believe it was just half-past ten when he pulled alongside, for five bells were struck from all the other ships lying alongside of him, but not from his own, which at the time he noticed as very singular. As he approached the ship he saw two boats coming from the direction of her, but at the time he took no notice of them; but there is no doubt, he thinks, that these very boats contained the gang."

"But did they succeed in obtaining any of the treasure?" I again asked.

"No; not a cent of it, thanks to Chubb. They had tried to pick the lock; and when they found that they could not succeed in that, they tried gunpowder, but with the same result. The two English seamen were found tied in their bunks, and quite drunk. They acknowledged that the steward had given them three bottles of brandy early in the evening, as a present; and they made good use of it, for they were half-drunk the next morning. The rest of the crew were too much afraid of their own necks to offer any resistance or give the alarm. The *Wild Dayrell* sailed a couple of days afterwards, but with a fresh crew." And so ended Charley's account.

'About a week after this conversation,' continued the narrator, 'I appeared at the police court, and swore to every one of the gang, eight in number. They were sent for trial to the High Court, and were all found guilty of mutiny and conspiracy; and sentenced, four of them to penal servitude for life, two for fourteen years, and the remaining two for seven years each.'

'Amongst my letters from home I was not long in noticing one in the handwriting of my mother; this, singular though it may appear, I kept until the last, and toyed and played with it for a minute or two before I opened it. In that letter, gentlemen, occurs the following passage: "What were you doing, dear John, on the night of the 8th of March, at about ten o'clock, from that to half-past? I will tell you my reasons for asking. I had been very poorly during the whole of the day; so much so, that after a cup of tea, about six o'clock, I retired for the night. I fell asleep very soon, but it was a disturbed sleep, and I awoke two or three times. At about eight o'clock Jane brought me a cup of cocoa, and very soon afterwards I again fell asleep, and did not wake until about half-past ten, when I awoke with a fright. I dreamed that I had seen you walking along some strange street, and following you were three or four Chinamen. All at once they rushed towards you, at which you ran, but they ran faster than you did, and were rapidly gaining on you, when you at once made for the river, which was some hundred yards distant. You had gone about half-way when you slipped, and fell down; immediately the Chinamen were upon you, and one I saw with a long knife ready to strike you: but with that I awoke with a scream."

'Now, gentlemen, I wish to draw your attention to the fact, that the 8th of March, as mentioned in my mother's letter, was the same day that the *Wild Dayrell* affair happened, and also that the time from ten o'clock to half-past was the exact time that we were placed in the most imminent peril by the smashing in of the door-panel. You can call it what you like—a singular coincidence, or anything else you please; but the fact remains that, while on the very day and hour I was placed in great danger of my life, my mother, fourteen thousand miles away, in dear Old England, had a dream in which I figured conspicuously; and although the incidents of the dream did not exactly tally with the actual facts of the case, yet they were so near the truth, that I think you will bear me out, gentlemen, when I state that it was a most extraordinary and remarkable dream.'

#### AFFAIR OF THE DIAMOND NECKLACE.

A DIAMOND necklace, possibly the most costly in the world, certainly the most celebrated, was one of the predisposing causes of the terrible French Revolution. Not that it was directly concerned in that fearful convulsion; but that it gave occasion, rightly or wrongly, to intensify the suspicions entertained of the hapless queen, Marie Antoinette, and thereby to raise to a pitch of madness the hatred of the Parisian mob against the royal family.

Just about a century ago, the French court was steeped in a lower abyss of immorality than at any period before or since. The king, Louis XV., was a *débauché* and little else; the nobles were nearly as bad as their sovereign; the higher ecclesiastics carried shameless dissoluteness to a pitch hardly credible to readers at the present day; while the royal palaces were thronged with intriguing adventurers of both sexes. The

prime favourite was the beautiful but heartless Madame Dubarry. On her the king lavished wealth that was sorely needed by his impoverished country. In the last sixteen months of his worthless life, he showered down upon her sums of money equal to a hundred thousand pounds sterling, besides salaried offices, houses, and lands. He furthermore determined, in his infatuation, to present her with a diamond necklace, such as no empress or queen possessed. The crown jewellers, MM. Bohmer and Bassenge, were commissioned to make it, at an estimated cost of two million francs (eighty thousand pounds). The whole of Europe was ransacked for diamonds of sufficient size and lustre to form component elements in the necklace, the most skilful diamond-cutters to shape them, the most tasteful jewellers to set them. Bohmer and Bassenge exhausted nearly all their own capital, borrowed more from friends, and obtained credit to a considerable amount from foreign diamond-merchants. And so the costly necklace was finished.

Carlyle brings this gorgeous ornament before us vividly in his own graphic style: 'A row of seventeen glorious diamonds, as large almost as filberts, encircle, not too tightly, the neck a first time. Looser, gracefully fastened thrice to these, a three-wreathed festoon and pendants, simple pear-shaped, multiple star-shaped, or clustering amorphous, encircle it, enwreath it a second time. Loosest of all, softly flowing round from behind in priceless catenary, rush down two broad threefold rows; seem to knot themselves round a very queen of diamonds, on the bosom; then rush on, again separated, as if there were length in plenty: the very tassels of them were a fortune for some men. And now, lastly, two other inexpressible threefold rows, also with their tassels, will, when the necklace is on and clasped, unite themselves behind into a doubly inexpressible six-fold row; and so stream down, together or asunder, over the hind neck—we may fancy like lambent zodiacal or aurora-borealis fire.' We can almost see the very thing before us, in these few lines of description.

Just before the necklace was finished, in 1774, the dissolute king died, to the dismay of MM. Bohmer and Bassenge. Madame Dubarry withdrew from court, with her ill-gotten money; sorry, no doubt, that she could not get the diamond necklace as well, and the jewellers equally sorry that they could not obtain the purchase-money from her.

New actors appear upon the scene. The young king, aged twenty, was Louis XVI.; and his queen, also aged twenty, was Marie Antoinette. He was simple-minded and quiet, she was light-hearted and fond of gaiety; but neither of them evinced a taste for the profligacy which had so disgraced the preceding reign. The youthful queen, prone to balls and assemblies and brilliant life, had also the natural fondness of young queens for jewels. Bohmer and Bassenge had hopes in this quarter. They obtained admission to the

queen, and displayed the matchless necklace before her admiring eyes. Whether she scorned, as a young wife, to wear that which had been intended for a worthless courtesan; or whether she knew that the finances of France were in too embarrassed a condition to justify an expenditure of public money in this way—certain it is that she refused to treat for costly glitter. A pair of diamond earrings, costing sixteen hundred pounds, were still in great part unpaid for; and it was not a time for her to run farther into debt. Almost in despair, Bassenge visited various courts of Europe, in the hope of tempting some empress, queen, or princess to purchase the diamond necklace; while Böhmer remained in Paris, watchful for any favourable symptoms that might present themselves. Thus ended 1774, thus 1775, and thus many succeeding years, during which time the gorgeous ornament never left the hands of the jewellers.

Now we come to the eventful part of the story—a conspiracy in which many persons were concerned, and of which Marie Antoinette was unquestionably the victim. We say ‘unquestionably,’ because the verdict of Europe has pretty well settled down to an acquittal of her. We must go back several years, to introduce a new actress upon the scene.

The Marquis and Marchioness de Brinvilliers, when driving out of Paris, were one day accosted by a ragged girl, who asked alms for a descendant of Henry II. of France! The lady requested the girl to call on her on the following day, and explain this singular application. There is no reason to doubt that the averment was actually true. Henry II. had an illegitimate son, to whom he gave the title of Count de Saint Remi. The count was rich and influential; but his descendants became gradually impoverished, until at length, about the middle of the last century, the family was represented by Jacques de Saint Remi, who lived almost in beggary at Bar-sur-Aube. He kept parchments in his possession relating to the lygone estates of the family, and was always seeking for some patron, to aid him in obtaining restitution of property to which he conceived he had a rightful claim. When he died, he left three children quite unprovided for; and one of these was the beggar-girl above mentioned. The marchioness, interested in the story, took the girl and a younger sister under her care, clothed them, and sent them to a ‘pension,’ or boarding-school. Jeanne, the elder, remained some years at school, then became apprentice to a milliner, then resided for a time in a convent, and afterwards removed to Bar-sur-Aube. Her descent from the royal House of Valois was acknowledged, and a small pension granted to her by the crown; but all attempts to get back estates and revenues were fruitless. Grown up to be a handsome young woman, Jeanne had lovers in plenty in her native town, among whom were M. de Beugnot and M. de la Motte; the latter of whom she married in 1780.

He was a young scapegrace who lived by his wits. The couple, assuming the titles of Count and Countess de la Motte, begged and borrowed money from all who would give or lend, especially worrying courtiers and influential persons by their importunities, and wearying ministers and judges about the Valois estates. Among those who paid attention to these representations was Cardinal de Rohan, a man who—if we are to believe Madame Campan, one of the ladies in attendance on the queen—was intriguing and dissolute, a discredit alike to the nobility and the church.

Now we come back to the necklace. MM. Böhmer and Bassenge were still the owners of it in 1784, as they had been for ten years; all attempts to get it off their hands had failed. The poor queen was beset by three tormentors at once: M. Böhmer, to induce her to buy the necklace; the Countess de la Motte, to induce her to take an interest in the Valois question; and De Rohan, who was at that time in disgrace at court, and wished to obtain an intercessor. She refused to see one and all of them, and out of this refusal arose a series of intrigues and crafty designs of most extraordinary character. The countess persuaded De Rohan that she was in the habit of seeing the queen frequently, and had influence with her. The cardinal believed this, supplied her with money, and commissioned her to intercede for him with Marie Antoinette. At this point we come into a very atmosphere of lies. The countess stood as low in moral character as De Rohan; the relations between them were very equivocal, but in later years each gave a flat denial to the assertions of the other touching the events of this period. One admitted fact was, that the countess gave to De Rohan, from time to time, letters purporting to come from the queen; expressing the great interest she felt in him and his affairs, and gradually breathing a warmth of sentiment alike inconsistent in a queen and a wife. An agent of the countess, Rétaux de Villette, afterwards confessed that he wrote these letters, forging and imitating to the best of his ill-applied skill, and using letter-paper similar to that used by the queen. De Rohan, we are told, believed that the countess was in the habit of seeing Her Majesty, believed that the queen wrote the letters to him, believed that she was warmly and deeply interested in him; and he shewed his gratitude by liberally supplying the countess with money.

The historically famous ‘Secret Interview,’ in August 1784, was either an unpardonable error on the part of the queen, or an act of unparalleled audacity on the part of the countess; impartial history, now that the heat of contemporary excitement has passed away, leaves little doubt that the latter was the case. According to the accepted version of this extraordinary affair, the countess employed an agent to seek out among the young women who frequented the Palais-Royal and other public places some one who bore as near a resemblance as possible to the queen in form and feature. One Mademoiselle Legnay Designy was selected. The countess, at an interview with her, promised her fifteen thousand francs if she would

fully carry into effect a plan laid down for her guidance. She was to be in a particular spot in the palace gardens at midnight on a certain day, dressed in a way to conceal her features as much as possible; she was to carry on a cautious conversation with a gentleman she would there see shrouded in a cloak; and she was to retreat on receiving a signal from the countess, who would be near at hand. Whatever else in this strange affair may be disputed, it is admitted that De Rohan met a veiled lady at that time and place; that he believed her to be the queen; that the queen to the day of her cruel death indignantly denied any complicity in or knowledge of the matter; and that both the countess and Mademoiselle Designy afterwards confessed that the latter was the real veiled lady. De Rohan blindly believed the countess in these and other matters, and credited her statement (at the time) that the queen had sought this interview; it is also certain that he gave her much money, under the impression that she was pleading his cause with the queen.

It was in January 1785 that the profligate countess laid a plan concerning the famous diamond necklace. She told De Rohan and the jewellers that the queen really wished to obtain the necklace, but was afraid to ask the king or his ministers for the money to pay for it; and she plied her artillery so skilfully as to induce the cardinal to purchase the costly jewel. He was to pay for it by bonds, to fall due at four successive periods; and the queen would (the countess asserted) provide means for these payments. The form of the bonds was drawn up by the cardinal himself; the penmanship was managed under the control of the countess; and the royal signature to each bond, which he believed to be the queen's, was forged by the countess's creature, Rétaux de Villette. De Rohan expected that he would have the honour of handing over the necklace to the queen in person; but this was the last thing that the countess intended. She cajoled him, by means of pretended messages and notes from the queen, to give the precious necklace to herself (the countess), to be by her handed over to the royal lady. Poor Marie Antoinette neither saw nor wrote to any of the persons concerned; that she was utterly ignorant of this plot, as of the previous secret interview, there is now hardly a doubt in the mind of any one; whether the countess victimised De Rohan or not, one or other of those two worthies certainly victimised the queen.

De Rohan and the jewellers were alike surprised that Her Majesty did not wear the diamond necklace, even on the grandest state occasions. The countess quieted their fears by fibs invented for the purpose; and at the same time persuaded them to avoid all public mention of the royal purchase of the jewel. When the first bond was coming due, in August, the countess told De Rohan that Her Majesty had pressing need for money, and wished him to make some arrangement for postponement. This made him uneasy; but the countess induced him to believe that she had actually seen the bank-notes in the queen's hands. He little suspected that she had neither seen the queen's bank-notes nor the queen herself. He made arrangements with the jewellers to delay the taking up of the bond until October.

Meanwhile, where was the necklace? The De la Mottes knew, if no one else did. Of course they would not have dared to offer so costly and celebrated a treasure for sale; instant exposure would have attended such a step. The count took it to pieces with his own hands, and cautiously sold many of the brilliants one by one—some in Paris, some in Amsterdam, some in London. The countess lived in grand style during that summer, on the proceeds of these diamond sales, somewhat to the perplexity of De Rohan. He knew not how she could obtain the means; what he did know was, that the (feigned) letters from the queen, given to him by the countess, were becoming more scanty and more cold; and that Her Majesty took as little notice of him as ever, when he occasionally attended Court.

The thundercloud was certain to burst soon; and it did burst early in August. M. Böhmer, not satisfied with the secrecy imposed upon him, on the one hand by De Rohan, and on the other by the countess, called on Madame Campan. That lady was inexpressibly astonished to hear his recital; she declared strongly that her royal mistress had had nothing whatever to do with the necklace. Marie Antoinette, when told of it, sent for Böhmer, and learned from his lips how busy De Rohan and the countess had been with her name and her signature. The simple-hearted king, not wishing to prosecute anybody, nevertheless saw that this was too serious an affair to pass unnoticed; he informed his ministers, and proceedings were resolved upon. Cardinal De Rohan was arrested, actually while in his sacerdotal robes in the chapel of Versailles; the Countess de la Motte was arrested three days afterwards; Mademoiselle Designy, and Cagliostro, the mysterious wizard of those days, were also captured; but the Count de la Motte eluded justice by escaping to England.

The parliament of Paris, which was rather a judicial tribunal than a legislative assembly, investigated the affair. The queen's signature had been forged on certain bonds; the diamond necklace had never reached her hands; and the jewellers had not yet received a penny of real cash for it—here were facts amply sufficient to employ legal acuteness and judicial impartiality. In January 1786 the proceedings began. They were of a voluminous character, almost reminding us of our Tichborne case. The perjury must have been something awful; for the declarations and counter-declarations contradicted one another with an audacity utterly amazing. The moral character of the nation, especially in the courtly class, had been brought down so low during the preceding reign, that a regard for truth was little cultivated. The cardinal protested that his one object had been to regain the favour of his sovereign, through the kind intercession of the queen; that he had thoroughly believed in the influence which the countess claimed to have with Her Majesty; and that he had been grossly deceived from first to last. The countess boldly denied everything that incriminated herself, declaring that she had been victimised by the cardinal, instead of making him her victim. It was an awkward thing for her that Rétaux de Villette confessed to the writing of the letters and the forging of the queen's signature; and that Mademoiselle Designy confessed the part she had played at the secret interview. The

countess, however, nothing abashed, either denied everything, or turned it to her own credit; she wrote and published two or three pamphlets during the lengthened trial, painting herself almost as a paragon of virtue and long-suffering. None of the accused, none of the witnesses, made any direct charge against the queen at the trial; even the countess shrunk from doing this when pressed to say when and where she had had conversations with the queen, and had received letters from her for De Rohan.

At the end of May, a verdict was given and sentences pronounced. The Count de la Motte was to be flogged, branded, sent to the galleys for life, and his property confiscated (but he took care to keep quiet in England); the Countess de la Motte, with a halter round her neck, was to be flogged, branded on both shoulders with a hot iron, and imprisoned for life in the Salpêtrière—a gaol for abandoned women; Cardinal de Rohan, Cagliostro, and Mademoiselle Designy were acquitted; while Rétaux de Vilette was banished for life. The king and queen were indignant at the acquittal of the cardinal; an opinion prevailed that De Rohan and his influential friends had bribed some of the judges, a delinquency not inconsistent with the low moral tone of the age. The king deprived him of his offices, and sent him to reside at one of his country estates, away from Paris.

Alas, poor Marie Antoinette! The Paris populace refused to believe her innocent of the diamond necklace affair. Three years later, when the Revolution of 1789 began, she was taunted and reproached with it; and when, in 1793, her career was ended by the guillotine, the necklace was pointedly included in the catalogue of heinous crimes imputed to her.

What was the fate of the necklace, we have already said; the diamonds were sold separately, and became the property of various owners. De Rohan was allowed by the National Assembly to return to Paris in 1789; he had a temporary restoration of influence, but deemed it prudent to retire during the horrors of the Revolution; and died, quiet and impoverished, in 1803. MM. Bohmer and Bassege were paid for the necklace in instalments by him and his friends; there was no getting over this, for the bonds had really been given to them by him, however much he may have been deceived by the countess. Rather, we should say, they were *partly* paid; the failure to obtain the rest of the money brought them to bankruptcy. About the middle of 1787, the countess escaped from prison (with the connivance, it is believed, of the authorities), and joined her husband in England. The pair kept up a succession of schemes for many years, to convert the rest of the diamonds into money, and to obtain favour at Paris by mingled entreaties and menaces. The countess remained in England till 1792, when she met with an accident which led to her death. The count, readily pardoned by the Revolutionists, returned to Paris, and was for a time in favour, first with Mirabeau and Bailly, afterwards with Robespierre and Danton; but he gradually slunk out of notice, and lived nearly forty years longer, begging from every one who would give.

This is the eventful story of the Diamond Necklace. Very few persons now believe that the hapless queen had aught to do with it.

## THE FLOWERS' CHOICE.

I HEARD the flowers on a day  
Confess in turn the fate which they  
Would deem most blessed.  
The timid Violet whispered: 'I  
Would choose to live—I dare not die!  
Let me be pressed!'

The Moss-rose raised its dainty head,  
And blushing: 'Ah! what bliss,' it said,  
'For aye to rest  
On some fair maiden's bosom soft,  
And, with her loving fingers, oft  
To be caressed!'

The gaudy Peony declared,  
As arrogant around it stared:  
'To be admired  
Is all I ask! And 'tis my due;  
My loveliness leaves nothing new  
To be desired!'

The modest Daisy said: 'I know,  
Alas! I am not fit to grow  
'Mid such as ye!  
Yet God hath given to each a place  
To occupy a little space,  
Though mean he be.

Content with my estate, I pray,  
Where He has placed me, there to stay  
Till life is done;  
Enjoying warmth, enjoying light,  
Until my everlasting night  
Obscure the sun!'

And last the Lily, fair and mild,  
Spoke, sighing: 'When a little child  
Is snatched by Death,  
I'd love to nestle pure and bright  
Within its hands so cold and white;  
Or, in a wreath

I'd twine me o'er the coffin's lid,  
Till from the mother's sight 'twas hid;  
And I would make  
The hideousness of Death appear  
Less foully hideous—almost fair,  
For her poor sake!'

The Lily spoke; and for a space  
The dewy tears were shed apace!  
And all confessed,  
Who heard her gentle words, that she,  
So full of love and sympathy,  
Had chosen best!

## THE AUSTRALIAN DESERT.

ON looking at a map of the Australasian continent, one cannot fail to observe that, though Western Australia occupies a larger space than any of its sister colonies, a vast extent of it remains a blank, unmarked as the dwelling-place of man, a huge expanse of desolation; and this although the earliest discovered portions of the continent are included within its boundary. The story of Western Australia is one of almost incredible hardship, disappointment, and gloom, but also of pluck, determination, and patience, though, so fettered has the energy of the colonists been by the nature of the country and the small area of agricultural land yet discovered, that in 1848 the inhabitants seriously entertained the project of abandoning the settlement for good. Since then, repeated expeditions have been organised for the exploration of the great blank space which constitutes a little less than one-fifth of the entire continent, and forms the western slope of that which geographers call 'the Great Interior Basin.' On the whole, these expeditions have achieved but little, at a great cost of life, money, toil, and suffering; and there is hardly any hope that it will ever be possible to construct that overland route from east to west, which would be of immense advantage to both regions, for South Australia needs fresh outlets for her capital, and Western Australia longs to pierce through the mystery of the desert which shuts her in upon the landward side, and says to her people, 'Thus far shall ye go, and no farther.' The explorations which preceded that of Colonel Egerton Warburton—known severally as the expeditions of Sturt, Eyre, Stuart, Gregory, and McKinlay—had, with the exception of Mr Stuart's discoveries on the banks of the Adelaide River, which led to the addition of hundreds of thousands of fertile acres to the colony of South Australia, been almost destitute of result. The upshot of them all is briefly described by Mr Eden as follows: 'We have followed Sturt until a sea of sand checked his progress; we have seen the brothers Gregory,

one striking from the north, the other from the north-west, both brought to a standstill by the same obstacle; and of the arid nature of the country bordering the Great Bight, Mr Eyre's terrible journey has sufficiently convinced us. On the other hand, we have Stuart discovering a fertile belt, running due north and south through the very centre of the continent, by means of which the communication between the two seas had been rendered comparatively easy. Diverge from it fifty miles east or west, and the sand-ridges in all their hideous uniformity are before the traveller. Colonel Egerton Warburton availed himself of Stuart's route until he gained the centre of the continent, and then struck boldly into that terrible western desert of which his predecessors had given so appalling a description.'\*

The first great and hopeful difference between Colonel Warburton's expedition and its predecessors was the employment of camels. In 1866, Mr Elder, an influential and wealthy colonist, imported 121 camels from Kurrachee, with a dozen Afghan drivers, and the animals were found to thrive admirably upon the Australian vegetation. The Afghan drivers taught the colonists how to treat and drive the great strange beasts; making them understand that they must lay aside stock-whips and bad language, for neither would avail with the camel, who is most docile and hard-working while he is well treated, but quite unmanageable and exceedingly dangerous if he be not. Mr Elder's camels increased and multiplied, and proved themselves most valuable for every kind of service in which they were employed. In August 1872, the advisability of exploring the interior between Central Mount Stuart and Perth was recognised by the government of Western Australia, and the Warburton expedition was organised. Mr Elder generously placed his camels at the disposal of the government, and offered to provide native drivers, both free of expense. The

\* *Journey Across the Western Interior of Australia.* By Colonel Peter Egerton Warburton, C.M.G. With an Introduction by Charles H. Eden, Esq. London: Sampson Low & Co.

government afterwards withdrew from the undertaking; and Mr Elder, assisted by Mr Hughes, also an influential colonist, resolved to carry through, upon their own responsibility, a liberal and patriotic design, which deserves acknowledgment and commemoration.

A glance at the map shews us Beltana station, the headquarters of the camels, where the party was to muster, and thence to proceed to the Peake, the principal depot of the persons employed in the construction of the overland telegraph. From this point, Colonel Warburton was to make a *détour* to the westward, through unknown country, test the capabilities of the camels, familiarise the whole party with the character of the territory they would afterwards have to penetrate, and rejoin the line at Central Mount Stuart. There he would receive a reinforcement of camels, and 'strike out straight for the capital of Western Australia.'

With some modifications, this plan was carried out; and on April 15, 1873, the exploring party started from Alice Springs on their way through the untracked regions and 'antres wild.' It consisted of Colonel Egerton Warburton and his son, an accomplished bushman; Lewis, an attendant on them; two Afghan camel-drivers; Dennis White, who was to cook, and act as assistant camel-driver; and Charley, a native lad. They had four riding, twelve baggage, and one spare camel, and six months' provisions. The start of these seven human beings for the wilderness, with their long train of grotesque animals in single file, was a curious sight—those who saw it could hardly have pictured, let their imagination have been ever so vivid, what lay before the small, stout-hearted party. The first part of the journey lay over grassy plains; then came scrub, and grass again, and the first terrible touch of apprehension of want of water. They had been assured that the Hugh River would be found as a creek beyond the McDonnell ranges; but no creek was there; and without water to drink or to cook their food with, they lay down beneath the stars on the fifth night of their journey. The next day, rain fell in abundance, and Colonel Warburton recorded the experience of those few hours in his journal, with the comment: 'I hope we may never forget this day.' He had probably maturely considered the enterprise he had embarked in, and studied its risks; but it would have been happily impossible for him to conceive to what insignificance the future sufferings which lay before him and his party would reduce the remembrance of that day. From that time the word 'water' holds an ominously prominent place in the colonel's journal; to the finding of water everything is subservient; the story makes one thirsty as one reads it. Sometimes water is struck on the day's march, and the camp is peacefully pitched; sometimes there is no surface-water, and a scanty supply is with difficulty obtained from rock-holes and clay-pits. The face of the country is undulatory, and covered with the cruel spinifex, and with casuarina forest, the tall, straight-stemmed trees lending it a melancholy beauty. 'The trees stand in thousands and thousands,' says Colonel Warburton of one great tract over which they marched early in May; 'but there is not a scrap of food nor a drop of water in the country.' On the 9th, having sustained a severe loss of a fine camel,

they reached some grand and imposing glens, and there the camels behaved provokingly. They were so frightened at the stupendous rocks, that they could not be got to the water, and would not even taste it when it was brought to them in a bucket. This, too, when it was of so much importance that they should lay in a good supply to carry them through the dry country beyond the glens. It must have been hard for the men to turn their backs on such a scene as those glens presented—on the majestic beauty of them, and the bountiful water-supply. At the entrance of the first glen, a huge column of basalt has been launched from a height of three hundred feet, and has stuck perpendicularly in the ground, where it stands sentry over the beautiful pool which occupies the whole width of the entrance to the glen. 'The pool is about fifteen feet wide, fifty long, and the basaltic walls which inclose it are about three hundred feet in height. A turn in the glen at a right angle to the first shews a still grander split in the mountain, with a circular pool of deep clear water, almost wholly roofed over by a single huge slab of basalt. As the sun cannot reach this water, it never can fail.' How often must this scene have come back to the explorers afterwards, with all the cruel charm of a mirage, to their sick senses and fainting hearts! This last glimpse of beauty was succeeded by scrub and spinifex, or, as it is more expressively called, porcupine grass, a horrid growth, which contributed largely to both the toil and the danger of their task. Colonel Warburton describes it in his plain, patient way as a sharp, spiny grass, growing in tussocks of from eighteen inches to five feet in diameter, of the colour of wheat-straw, so that it only adds desolation to the aspect of the wilderness. It is quite uneatable, even for camels, who are compelled to thread their way painfully through its mazes; and to horses it proves most destructive, piercing and cutting their legs, which in a very short time become fly-blown, when the animals have to be either destroyed or abandoned. The country it grows in is utterly useless for pastoral purposes. The presence of this harassing and destructive growth must be constantly borne in mind among the hardships of the explorers' journey.

On they go through the dreary land, under the hot sun, forced to diverge constantly from the track in search of water; suffering from want of bread and vegetables; delayed by the straying of the camels; terribly inconvenienced by some of those animals getting sore back; alarmed by the illness of one of the drivers; and when they have travelled 1700 miles, and yet have hardly made any progress towards Perth, disheartened by the loss of three camels, which were vainly pursued for a hundred miles! Then came salt lagoons, and dust-storms, during which the men crouched by the side of the beasts, to hide from the swirling clouds of sand and ashes from the burnt ground—burned by the natives when they had camped there. Once or twice they caught sight of some wretched wandering natives; but these fled from them, and the party could only follow up their tracks, in hope of coming to the blessed water. The story is terrible in its very monotony; over and over again come entries like this: 'I sent two men, in the evening, on our back-track, to see if they could trace to water the natives whose yam-digging marks we saw yesterday. This is our last chance;

if it fail, we must go over those terrible sand-hills again to our last water! It will ruin the camels; but there is no alternative. I dare not work them on a chance. What they can do must be all on a certainty of getting water at the end.' The attempt was successful on this particular occasion; water was found, and the party pushed on over sandy desert towards a range of basaltic hills, which their leader hoped might be the entrance to a better country; but the hope proved delusive, and the difficulties increased from that time. On the 14th September it became evident that the camels were breaking down, the men only holding out, and that day-travelling must be abandoned. They were journeying through the sand-ridges, which are totally unlike any other known portion of the globe, and form a wilderness utterly divested of animal life, portions of which appear as though they had recently formed part of the bed of the ocean, but whercon shrubs are found which supply food for camels, though nothing edible to a human being. Misfortunes come thick upon the party. Their 'master bull-camel,' a beast which keeps all the others in a well-understood subjection, eats poison, and dies; two riding camels are struck in the loins by the night-wind, and cannot stir; they are abandoned; and next day a similar accident occurs to the riding camel of Mr Warburton. The camel-men say the disease is common in their country, and always comes in the night, when a certain star is in the ascendant. They killed this animal for meat, and the necessity for doing so was the first indication of the new distress—want of provisions—that was coming upon them. The knowledge of the constant danger of the camels from this wind-blight came with a shock to Colonel Warburton, and it proved only the beginning of evils.

In one year after the departure of the exploring party from Adelaide, in five months after their start from Alice Springs, we find them struggling through awful wastes, with the sick and emaciated creatures which are destined to be their disgusting but sole resource against starvation, in such straits, that only two riding camels are left. The tents and every article except guns and ammunition, and just so much clothing as is required for decency, have been thrown away, and they are in a country where, if they do not come on natives' tracks, and find their well, they will have to go back fifty miles, and so exact from the quickly failing strength of the camels an additional hundred miles of travel before they can recover their present position. On the anniversary they did find a well, and they rested awhile; but when they pressed on again, it was amid torments from ants, flies, and especially from the hideously ill-smelling 'honey-fly,' great heat, the illness of every man of the party, and with a dying camel, whose loss reduced their number to eight; forced too to retreat to the forsaken camp, a week later, because there was no water to be found; so that in ten days they had only made a few miles' advance, were already on short allowance of food, and had the prospect of starvation before them.

On the 1st of October they went on in a north-westerly direction, having found tracks. Here is the leader's quiet, brief entry of the situation: 'Our hopes are raised at finding a different class of water, and though it has taken us to lat. 20° 2', we must follow its line; our great disadvantage lies in being unable to make any extensive search in our

front, for want of camels, or to travel by day, on account of the heat, which utterly prostrates them. When we move, we can't see; when we stop, we can't search.' Suffocating heat at night, and ceaseless worry of insects precluding sleep; pressing on by night, to be driven back by want of water; failing provisions; days 'which only men can bear uninjured; the beasts cannot stand the heat;' the chance, if they attempt to make more progress, of losing their camels, and dying of thirst; the certainty, if they stand still where water is, of being able to prolong their lives only for the time that their sun-dried camel-flesh may be made to last. So comes to them October, and the fifth remaining camel knocks up. Lewis, whose exertions all through the journey have been preternatural, finds a wretched well, which yields one bucket after three hours of hard work; but the camel cannot be saved; so they kill it, and have its jerked-meat between them and starvation; but the loss of it marks another stage on their way to destruction. Great was the economy these unhappy explorers practised in the utilising of the poor carcasses of their much-enduring, willing, worn-out beasts. To eat a camel meant to eat him *right through*; the inner portions first, not the liver and dainty parts only, but all. 'No shred was passed over; head, feet, hide, tail, all went into the boiling-pot, even the very bones were stewed down for soup first, and then broken for the sake of the marrow they contained. The flesh was cut into thin flat strips, and hung upon the bushes to dry in the sun. The tough thick hide was cut up and parboiled, the coarse hair was scraped off with a knife, and the leather-like substance replaced in the pot and stewed until it became like the inside of a carpenter's glue-pot, both to the taste and to the smell. Nourishment there was little or none, but it served to fill up space, and so was valuable to starving men. The head was steadily attacked, and soon reduced to a polished skull, tongue, brains, and cheeks having all disappeared.' As the worn-out creatures were ultimately the sole salvation of their masters, the particulars of this horrid food are interesting. Out of the whole number killed for food by Colonel Warburton, not one threw to the surface of the cooking bucket a single particle of fat. Exhausted and diseased, they afforded no more nutriment than is found in the bark of a tree, yet such was the food which *did* preserve the lives of the explorers, and without it they must have certainly perished.

One day in October they met some natives, who let them take water from their well, and bartered with them a wallaby, 'without which,' says Colonel Warburton, who was exhausted by illness and deprivation of sleep, 'I should not have reached our camp that night.' At the end of the month they are creeping on, sometimes forced to return on their tracks, having no beasts which could be sent on to scout, while the others were resting. Here is the colonel's ration-list for one Sunday: 'Half a quart of flour and water at 4 A.M., a hard sinewy bit of raw, that is, sun-dried but uncooked camel-meat at 2 P.M. Supper uncertain, perhaps some roasted acacia seeds; these are very small and hard; they grow on bushes, not trees, and the natives use them roasted and pounded.' What an event it was when a bird was shot, to be eaten uncleaned, lest anything should be lost; and how

rarely birds came in sight! The flies were quite horrible, and kept men and animals in perpetual torment, while they attacked the slightest abrasion of the skin, and turned it into a festering wound. The explorers were as much imprisoned as if they had been in a jail, without any of the advantages of prison dormitory and dietary; and owing to the fierce heat, which would have rendered it impossible that men or beasts could have lived long without an abundant supply of water, it seemed likely their advance might be stopped until the summer tropical rains of January should fall. This did not befall them, however, for the indefatigable Lewis, and Charley the black boy, searched out wells towards the south-west, and once more they started, hoping, by travelling on 'known water' for some days, to get the animals into condition for a rush across the dreadful sand-hills lying between them and the Oakover River, to reach which was now their only chance for life. At this time their sufferings from the ants were frightful. Often when the vertical sun poured down in full fierceness on their heads, and the poor shade afforded even by a bush would have been an inestimable blessing, the travellers were driven away from the shelter by their relentless persecutors, and in despair flung themselves down on the burning sand, where it was too hot even for an ant. Their flight was to be on 4th November, and they would have to take their chance of finding a little water somewhere in the one hundred and fifty miles of pitiless desert which separated them, the starving men, and their shrunken train of worn-out beasts, from the Oakover. 'Richard is very weak, and so am I,' writes the leader as they are starting at sunset. They marched that night through darkness caused by an eclipse of the moon, in which their weary procession must have looked weird and ghostly, and made twenty-five miles.

From this point the story becomes more harrowing than any that has ever been told, except that awful history which Mr Wills continued until he died of starvation, also in the Australian desert, and it includes every kind of bodily suffering, with hope deferred, and its attendant heart-sickness; for they fondly fancied themselves within three days' journey of the Oakover, whereas they did not strike the creek, its tributary, which denoted their release from the horrible desert in which they were wandering, until 2d November, a month, all but two days, after the start, of which they had hoped to make a rush. The terrible sand-hills, the cruel spinifex, the ailing animals, the constant halts and returns for water, the ever-vain hope of finding a country in which there might be something to eat, the actual experience of a country where there was not even a crow or a snake, the absence of all nutrition in the flesh of the diseased camels, which were one by one released from their sufferings by the knife—the sense of the uselessness of it all, the hopeless barrenness of the land they had come to see, the physical pain, and the natural shrinking of the spirit from death in such a place and such a way, make up a picture which presents itself in sombre colours to the least active imagination. Throughout, Lewis is a constant source of admiration and wonder; and once, when the leader, having just recorded his belief that men have never traversed so vast an extent of continuous desert, adds that they cannot get the few wallabies there are in the spinifex,

that the last riding camel has given in, that rest, even in their state of exhaustion, is rendered impossible by the ants, and that, if the advance party does not bring them relief, he and his son cannot live twenty-four hours—Lewis comes up with a bag of water, and news of a native camp only twelve miles off. They killed the sick camel, and started for the camp; and again Lewis went on to seek for indications of the Oakover, while Colonel Warburton and his son remained at the camp—where there was nothing to eat—keeping themselves and the others alive on the fragments of the last slain beast. Should they have to kill another, some of the party would have to walk, and not one was equal to the exertion. They had to kill another; for they did not get away until 1st December, after Lewis's return and report that he had found the road to the Oakover. Then Colonel Warburton records a horrible four days' march—tropical heat, thirst, hunger, no sleep, constant torture from the ants, semi-blindness, such weakness that he had to be tied on his camel's back, as the animal plunged head foremost down the steep sand-hills; and on the fourth day they camped on a tributary to the Oakover, and were out of the wilderness indeed, in a place where the camels could have water and rest.

But the haunting question of food for themselves drove the party on; on the 6th they had been two days without food, and could find nothing but bulrush roots. They were forced to return to the creek, and to kill another camel; and now there were but three left. There were fish in the water, but no means of taking them. 'A light twine-net would be worth its weight in diamonds to us now,' says Colonel Warburton; 'let no Australian traveller ever go out again without one.' It was nearly over with them; the camel-meat did not revive them; soon the strongest would be unequal to the least exertion; help in food and carriage must be obtained, or they must all die. The only thing to be done was to locate the party at the best attainable place on the Oakover, and send two men down the river to look for the settler's station. If they should live to reach it, and return with aid, the others might have been able to endure the starvation until their return; they might find them still alive. With this dim, grim hope, they struggled on to a beautiful mocking spot on the river-edge, and camped. 'I sent off Lewis and one Afghan,' says Colonel Warburton, 'on the only two camels that could travel. They are to look for the station of Messrs Harper and Company; we do not know how far it may be, or whether it may not have been abandoned, but must take our chance; it is the only one we have.' Then the four men and the boy, and the one camel—for whom the desert had been, too much, for though it had food and water and rest, it was dying, and they could only hope it would last until the time should come when they must kill it, to keep themselves alive a little longer—waited! Lewis left them on the 13th; on the 19th, they killed the last camel, and ate voraciously 'all day.' What if he should find no station? How is he to hold out with his scanty supply of food? Awful questions these, and their minds can hold no others. Christmas Day! And they 'lie sweltering on the ground, and would be thankful to have the pickings out of any pig's trough.' On the 29th, they have abundance of water, a little tobacco, a few bits of dried camel, and

a hope that the rain will bring up some thistles or pigweed. They cannot catch the fish; they cannot find 'possums or snakes, the birds will not sit down by them, and they are unable to get up and go to the birds. On that morning, Colonel Warburton wrote these lines in his journal: 'We must wait patiently. I am sure Lewis will do all that can be done. His endurance, perseverance, and judgment are beyond all praise. My great fear is that the summer rains may set in, and stop his return, but we must hope for the best.' A few hours afterwards, Lewis returned! He had found the station one hundred and seventy miles off, and brought back ample supplies for all the wants of the party, with six horses to carry them down to Roebourne.

No man's life had been lost, but a year of intense suffering had been endured by the men and the beasts in the exploring party. The result is absolutely *nil*, except in honour. Colonel Warburton and his son did their duty nobly; Lewis proved himself a hero. The Council and Burgesses of the city of Perth declare that 'the expedition has prepared the way for future explorers to disclose to us the characteristics and resources of our island continent.' Considering the nature of these characteristics and resources—horrible wilderness, and the absence of anything to support human life—we think the less they are disclosed the better, and hope Colonel Egerton Warburton's expedition may have no successor.

## THE FLAG OF DISTRESS.

## CHAPTER XXXII.—'AMBRE LA PUERTA!'

ANOTHER sun has shone upon San Francisco Bay, and gone down in red gleam over the far-spreading Pacific, leaving the sky of a leaden colour, moonless and starless. As the hour of midnight approaches, it assumes the hue predicted by Rocas, and desired by Diaz. For the ocean fog has again rolled shoreward across the peninsula, and shrouds San Francisco as with a pall. The adjacent country is covered with its funeral curtain, embracing within its folds the house of Don Gregorio Montijo. The inmates seem all asleep, as at this hour they should. No light is seen through the windows, nor any sound heard within the walls. Not even the bark of a dog, the bellow of a stalled ox, or the stamping of a horse in the stables. Inside, as without, all is silence. The profound silence seems strange, though favourable, to four men not far from the house, and gradually, but with slow steps, drawing nearer to it. For they are approaching by stealth, as can be told by their attitudes and gestures. They advance crouchingly, now and then stopping to take a survey of the *terrain* in front, as they do so exchanging whispered speech with one another.

Through the hazy atmosphere their figures show weird-like—all the more from their grotesque gesticulation. Scrutinised closely and in a clear light they would still present this appearance, for although in human shape, and wearing the garb of men, their faces more resemble those of demons. They are human countenances, nevertheless, but craped—*enmascaradas*. Nothing more is needed to tell who and what they are, with their purpose in thus approaching Don Gregorio's dwelling. They are burglars, designing to break it.

It needs not the removal of their masks to iden-

tify them as the four conspirators left plotting in the ranche of Rafael Rocas.

They are now *en route* for putting their scheme into execution.

It would look as if Don Gregorio were never to get his gold to Panama—much less have it transported to Spain.

And his daughter! What of her, with Francisco de Lara drawing nigh as one of the nocturnal ravagers? His granddaughter, too, Faustino Calderon being another?

One cognisant of the existing relations, and spectator of what is passing now—seeing the craped robbers as they steal on towards the house—would suppose it in danger of being doubly despoiled, and that its owner is to suffer desolation, not only in fortune, but in that far dearer to him—his family.

The burglars are approaching from the front, up the avenue, though not on it. They keep along its edge among the manzanita bushes. These, with the fog, afford sufficient screen to prevent their being observed from the house—even though sentinels were set upon its azotea. But there appears to be none; no eye to see, no voice to give warning, not even the bark of a watch-dog to wake those unconsciously slumbering within.

As already said, there is something strange in this. On a large grazing estate it is rare for the Molossian to be silent. More usually his sonorous bay is heard sounding throughout the night, or at short intervals. Though anything but desirous to hear the barking of dogs, the burglars are nevertheless puzzled at the universal silence, so long continued. For before entering the inclosure, they have been lying concealed in a thicket outside, their horses tied to the trees where they have left them, and during all the time not a sound has reached them; not a voice either of man or animal! They are now within sight of the house, its massive front looming large and dark through the mist—still no sound outside, and within the stillness of death itself!

Along with astonishment, a sense of awe is felt by one of the four criminals—Calderon, who has still some lingering reluctance as to the deed about to be done—or it may be but fear. The other three are too strong in courage, and too hardened in crime, for scruples of any kind.

Arriving at the end of the avenue, and within a short distance of the dwelling, they stop for a final consultation, still screened by a clump of manzanitas. All silent as ever; no one stirring; no light from any window; the shutters closed behind the *rejas*—the great *puerta* as well.

'Now about getting inside,' says De Lara; 'what will be our best way?'

'In my opinion,' answers Diaz, 'we'll do best by climbing up to the *azotea*, and over it into the *patio*.'

'Where's your ladder?' asks Rocas, in his gruff blunt way.

'We must find one, or something that'll serve instead. There should be loose timber lying about the *corrales*—enough to provide us with a climbing-pole.'

'And while searching for it, wake up some of the *vaqueros*. That won't do.'

'Then what do you propose, Rafael?' interrogates De Lara.

The sea-fighter, with his presumed experience in housebreaking, is listened to with attention.

'Walk straight up to the door,' he answers; 'knock, and ask to be admitted.'

'Ay; and have a blunderbuss fired at us, with a shower of bullets big as billiard-balls. *Carrai!*' It is Calderon who speaks thus apprehensively.

'Not the least danger of that,' rejoins Rocas. 'Take my word, we'll be let in.'

'Why do you think so?'

'Why? Because we have a claim on the hospitality of the house.'

'I don't understand you, Rocas,' says De Lara.

'Haven't we a good story to tell—simple, and to the purpose?'

'Still, I don't understand. Explain yourself, Rafael.'

'Don't we come as messengers from the man-of-war—from those officers you've been telling me about?'

'Ah; now I perceive your drift.'

'One can so announce himself, while the others keep out of sight. He can say he's been sent by the young gentlemen on an errand to Don Gregorio, or the señoritas, if you like. Something of importance affecting their departure. True, by this they'll know the ship's weighed anchor. No matter; the story of a message will stand good all the same.'

'Rafael Rocas!' exclaims De Lara, 'you're a horn genius. Instead of being forced to do a little smuggling now and then, you ought to be made administrator-general of customs. We shall act as you advise. No doubt the door will be opened. When it is, one can take charge of the janitor. He's a sexagenarian, and won't be hard to hold. If he struggle, let him be silenced. The rest of us can go ransacking. You, Calderon, are acquainted with the interior, and, as you say, know the room where Don Gregorio is most likely to keep his chest. You must lead us straight for that.'

'But, Francisco,' whispers Calderon in the ear of his confederate, after drawing him a little apart from the other two; 'about the *niñas*? You don't intend anything with them?'

'Certainly not—not to-night; nor in this fashion. I hope being able to approach them in gentler guise, and more becoming time. When they're without a *peso* in the world, they'll be less proud; and may be contented to stay a little longer in California. To-night we've enough on our hands without that. One thing at a time—their money first, themselves afterwards.'

'But suppose they should recognise us?'

'They can't. Disguised as we are, I defy a man's mother to know him. If they did, then—'

'Then what?'

'No use reflecting what. Don't be so scared, man! If I'd anticipated any chance of its coming to extremes of the kind you're thinking about, I wouldn't be here prepared for only half-measures. Perhaps we shan't even wake the ladies up; and if we do, there's not the slightest danger of our being known. So make your mind easy, and let's get through with it. See! Diaz and Rocas are getting impatient! We must rejoin them, and proceed to business at once.'

The four housebreakers again set their heads together; and after a few whispered words, to

complete their plan of proceeding, advance towards the door. Once up to it, they stand close in, concealed by its overshadowing arch.

With the butt of his pistol, De Lara knocks.

Diaz, unknown to the family, and therefore without fear of his voice being recognised, is to do the talking.

No one answers the knock; and it is repeated. Louder, and still louder. The sexagenarian janitor sleeps soundly to-night, thinks De Lara, deeming it strange. Another 'rat-at-ta' with the pistol-butt, followed by the usual formula: '*Ambre la puerta!*' (Open the door). At length comes a response from within; but not the customary '*¿Quien es?*' (Who's there), nor anything in Spanish. On the contrary, the speech which salutes the ears of those seeking admission is in a different tongue, and tone altogether unlike that of a native Californian.

'Who the old scratch are ye?' asks a voice from inside, while a heavy footstep is heard coming along the *saguam*. Before the startled burglars can shape a reply, the voice continues: 'Darn ye! what d'ye want anyhow—wakin' a fellur out o' his sleep at this time o' the night? 'Twould surve ye right if I sent a bullet through the door at ye. Take care what you're about. I've got my shootin-iron handy; an' a Colt's revolver it air.'

'*Por Dios!* what does this mean?' mutters De Lara.

'Tell him, Diaz,' he adds, in *sotto-voce* to the cock-fighter—'tell him we're from the British man-of-war with—' *Carrai!* I forgot, you don't speak English. I must do it myself. He won't know who it is.' Then raising his voice: 'We want to see Don Gregorio Montijo. We bring a message from the ship *Crusader*—from the two officers.'

'Consarn the ship *Crusader*, an' yur message, an' yur two officers, I know nothin' 'bout them. As for Don Gregorio, if ye want to get sight on him, ye're a preeshus way wide o' the mark. He ain't here any more. He's gin up the house, y. terday, an' tuk everything o' hisn out o't. I'm my here in charge o' the place. Guess you'll find both the Don an' his darters at the *Parker*—the most likeliest place to tree thet lot.'

Don Gregorio gone!—his gold—his girls! Only an empty house, in charge of a care-taker, who carries a Colt's repeating pistol, and would use it on the slightest provocation! No good going inside now, but a deal of danger. Anything but pleasant medicine would be a pill from that six-shooter.

Many are the wild exclamations that issue from the lips of the disappointed housebreakers, as they turn away from Don Gregorio's dismantled dwelling, and hasten to regain their horses.

#### CHAPTER XXXIII.—A SCRATCH CREW.

It was a fortunate inspiration that led the ex-haciendado to have his gold secretly carried on board the Chilean ship; another, that influenced him to transfer his family and household gods to an hotel in the town.

It was all done in a day—that same day. Every hour, after the sailing of the *Crusader*, had he become more anxious; for every hour brought intelligence of some new act of outlawry in the neighbourhood, impressing him with the insecurity,

not only of his Penates, but of the lives of himself and the young ladies. So long as the British ship lay in port, it seemed a protection to him; and although this may have been but fancy, it served somewhat to tranquillise his fears. Soon as she was gone, he gave way to them, summoned Silvestre, with a numerous retinue of *cargadores*, and swept the house clean of everything he intended taking—the furniture alone being left, as part of the purchased effects. It is a company of speculators to whom he has sold the property, these designing to cut it up into town-lots and suburban villa-sites.

He has reason to congratulate himself on his rapid removal, as he finds on the following day, when visiting his old home for some trifling purpose, and there hearing what had happened during the night. The man in charge—a stalwart American, armed to the teeth—gives him a full account of the nocturnal visitors. There were four, he says—having counted them through the keyhole of the door—inquiring for him, Don Gregorio. They appeared greatly disappointed at not getting an interview with him; and went off uttering adjurations in Spanish, though having held their parley in plain English.

A message from the British man-of-war! and brought by men who swore in Spanish! Strange all that, thinks Don Gregorio, knowing the *Crusader* should then be at least a hundred leagues off at sea. Besides, the messengers have not presented themselves at the *Parker House*, to which the care-taker had directed them. 'What could it mean?' asks the ex-haciendado of himself. Perhaps the sailor who is now first-officer of the Chilean ship may know something of it; and he will question him next time he goes aboard. He has, however, but little hope of being enlightened in that quarter; his suspicions turning elsewhere. He cannot help connecting Messrs De Lara and Calderon with the occurrence. Crozier's letter, coupled with further information received from the bearer of it, has thrown such a light on the character of these two individuals, that he can believe them capable of anything. After their attempt to rob the young officers, and murder them as well, they would not hesitate to serve others the same; and the demand for admission to his house may have been made by these very men, with a couple of confederates—their design to plunder it, if not worse.

Thus reflecting, he is thankful for having so unconsciously foiled them—indeed, deeming it a providence. Still is he all the more solicitous to leave a land beset with such dangers. Even in the town he does not feel safe. Robbers and murderers walk boldly abroad through the streets; not alone, but in the company of judges who have tried without condemning them; while lesser criminals stand by drinking-bars, hobnobbing with the constables who either hold them in charge, or have just released them after a mock-hearing before some magistrate, with eyes blind as those of Justice herself—blinded by the gold-dust of California!

Notwithstanding all this, Don Gregorio need have no fear for his ladies. Their sojourn at the hotel may be somewhat irksome and uncongenial, still are they safe. Rough-looking and boisterous as are some of their fellow-guests, they are yet in no way rude. The most sensitive lady need not fear

moving in their midst. A word or gesture of insult to her would call forth instant resentment.

It is not on their account he continues anxious, but because of his unprotected treasure. Though secreted aboard the *Condor*, it is still unsafe. Should its whereabouts get whispered abroad, there are robbers bold enough, not only to take it from the Chilean skipper, but set fire to his ship, himself in her, and cover their crime by burning everything up. Aware of this, Don Gregorio, with the help of friendly Silvestre, has half-a-dozen trusty men placed aboard of her—there to stay till a crew can be engaged. It is a costly matter, but money may save money, and now is not the time, to cavil at expenses.

As yet, not a sailor has presented himself. None seems caring to ship 'for Valparaiso and intermediate ports,' even at the double wages offered in the advertisement. The *Condor's* fore-castle remains untenanted, except by the six long-shore men, who temporarily occupy it, without exactly knowing why they are there; but contented to make no inquiry so long as they are receiving their ten dollars a day. Of crew, there is only the captain himself, his first-officer, and the cook. The oranges do not count.

Day by day, Don Gregorio grows more impatient, and is in constant communication with Silvestre. 'Offer higher wages,' he says; 'engage sailors at any price.' The ship-agent yields assent; inserts a second *aviso* in the Spanish paper, addressed to 'marineros of all nations.' Triple wages to those who will take service on a well-appointed ship. In addition, all the usual allowances, the best of grub and grog. Surely this should get the *Condor* a crew.

And at length it does. Within twenty-four hours after the advertisement has appeared, sailors begin to shew on her deck. They come singly, or in twos and threes; and keep coming till as many as half a score have presented themselves. They belong to different nationalities, speaking several tongues—among them English, French, and Danish. But the majority appear to be Spaniards, or Spanish-Americans, as might have been expected from the *Condor* being a Chilean ship. Among them is the usual variety of facial expression, though, in one respect, a wonderful uniformity. Scarce a man of them whose countenance is not in some way unprepossessing—either naturally of sinister cast, or brought to it by a career of sinful dissipation. Several of them shew signs of having been recently drinking—in eyes bleary and bloodshot. Of strife, too, by other eyes that are blackened, with scars upon their cheeks not yet cicatrised. Some are still in a state of inebriety, and stagger as they stray about the decks.

Under any other circumstances, such sailors would stand no chance of getting shipped. As it is, they are accepted—not one refused. Captain Lantanas has no choice, and knows it. Without them he is helpless, and it would be hopeless for him to think of putting to sea. If he do not take them, the *Condor* may swing idly at her anchor for weeks, it might be months. Quick as they come aboard, he enters their names on the ship's books, while Harry Blew assigns them their separate bunks in the fore-peak. One, a Spaniard, by name Padilla, shews credentials from some former ship that procure for him the berth of *piloto segundo* (second-mate).

After the ten have been taken, no more present themselves. Even the big bounty offered does not tempt another tar from the saloons of San Francisco. In any other seaport, it would empty every sailors' boarding-house to its last lodger. Still ten hands are not enough to work the good ship *Condor*. Her captain knows it, and waits another day, hoping he may get a few more to complete her complement. He hopes in vain; the supply seems exhausted. Becoming convinced of this, he determines to set sail with such crew as he has secured. But little more remains to be done; some stores to be shipped, provisions for the voyage, the best and freshest San Francisco can afford. For he who authorises their inlay cares not for the cost—only that things may be made comfortable. Don Gregorio gives *carte-blanche* for providing the vessel; and it is done according to his directions. At length everything is ready, and the *Condor* only awaits her passengers. Her cabin has been handsomely furnished; its best state-room decorated to receive two ladies, fair as ever set foot on board a ship.

#### CHAPTER XXXIV.—'ADIOS, CALIFORNIA!'

Another sunrise over San Francisco, in all likelihood the last Don Gregorio Montijo will ever witness in California. For just as the orb of day shews its disc above the dome-shaped *silhouette* of Monté Diablo, flinging its golden shimmer across the bay, a boat leaves the town-pier, bearing him and his towards the Chilian vessel, whose signals for sailing are out. Others are in the boat; a large party of ladies and gentlemen, who accompany them to do a last hand-shaking on board the ship. For, in quitting California, the ex-haciendado leaves many friends behind; among them, some who will pass sleepless hours thinking of Carmen Montijo; and others whose hearts will be sore as their thoughts turn to Inez Alvarez. It may be that none of these is in the boat, and better for them if they are not; since the most painful of all partings is that where the lover sees his sweetheart sail away, with the knowledge she cares neither to stay, nor come back.

The two young girls going off shew but little sign of regret at leaving. They are hindered by remembrance of the last words spoken at another parting, now painfully recalled: 'Hasta Cadiz!' The thought of that takes the sting out of this.

The boat reaches the ship, and swinging around, lies alongside. Captain Lantanas stands by the gangway to receive his passengers, with their friends; while his first-officer helps them up the man-rope.

Among the ladies, Harry Blew distinguishes the two he is to have charge of, and with them is specially careful. As their soft gloved fingers rest in his rough horny hand, he mentally registers a vow, that it shall never fail them in the hour of need—if such there ever be.

On the cabin-table is spread a refection of the best; and around it the leave-takers assemble, the Chilian skipper doing the honours of his ship. And gracefully, for he is in truth a gentleman.

Half-an-hour of merry-making, light chatter, enlivened by the popping of corks and clinking of glasses; then ten minutes of converse more serious; after which, hurried graspings of the hand, and a general scattering towards the shore-boat;

which soon after moves off amid exclamations of 'Adios!' and 'Bueno viaje!' accompanied by the waving of hands, and white slender fingers saluting, with tremulous motion, like the quiver of a kestrel's wing—the fashion of the Spanish-American fair.

While the boat is being rowed back to the shore, the *Condor* spreads sail, and stands away towards the Golden Gate.

She is soon out of sight of the port, having entered the strait which gives access to the great landlocked estuary. But a wind blowing in from the west hinders her; and she is all the day tacking through the eight miles of narrow water which connect San Francisco Bay with the Pacific.

The sun is high set as she passes the old Spanish fort, and opens view of the outside ocean. But the heavenly orb that rose over Monté Diablo like a globe of gold, goes down beyond 'Los Farallones' more resembling a ball of fire about to be quenched in the sea.

It is still only half-immersed in the blue liquid expanse, when, gliding out from the portals of the Golden Gate, the *Condor* rounds Seal Rock, and stands on her course W.S.W.

The wind has shifted, the evening breeze beginning to blow steadily from the land. This is favourable; and after tacks have been set, and sails sheeted home, there is but little work to be done.

As it is the hour of the second dog-watch, the sailors are all on deck, grouped about the fore hatch, and gleefully conversing. Here and there an odd individual stands by the side, with eyes turned shoreward, taking a last look at the land. Not as if he regretted leaving it, but is rather glad to get away. More than one of the *Condor's* crew have reason to feel thankful that the Chilian craft is carrying them from a country, where, had they stayed much longer, it would have been to find lodgment in a jail. Out at sea, their faces seem no better favoured than when they first stepped aboard. Scarce recovered from their shore carousing, they shew swollen cheeks, and eyes inflamed with alcohol; countenances from which the breeze of the Pacific, however pure, cannot remove that sinister expression.

At sight of them, and the two fair creatures sailing in the same ship, a thought about the incongruity—as also the insecurity of such companionship—cannot help coming uppermost. It is like two beautiful birds of paradise shut up in the same cage with half a score of wolves, tigers, and hyenas.

But the birds of paradise are not troubling themselves about this, or anything else in the ship. Lingered abaft the binnacle, with their hands resting on the taffrail, they look back at the land, their eyes fixed upon the summit of a hill, ere long to become lost to their view by the setting of the sun. They have been standing so for some time in silence, when Inez says: 'I can tell what you're thinking of, *tia*.'

'Indeed! can you? Well; let me hear it.'

'You're saying to yourself: "What a beautiful hill that is yonder; and how I should like to be once more upon its top—not alone, but with somebody beside me." Now, tell the truth, isn't that it?'

'Those are your own thoughts, *sobrina*.'

'I admit it, and also that they are pleasant. They are yours also; are they not?'

'Only in part. I have others, which I suppose you can share with me.'

'What others?'

'Reflections not at all agreeable, but quite the contrary.'

'Again distressing yourself about that! It does not give me any concern; and didn't from the first.'

'No?'

'No!'

'Well; I must say you take things easily—which I don't. A lover—engaged too—to go away in that *sans façon* manner! Not so much as a note, nor even a verbal message. *Santissima!* it was something more than rude—it was cruel; and I can't help thinking so.'

'But there was a message in the letter to grandpapa, for both of us. What more would you wish?'

'Pff! who cares for parting compliments? A *lepero* would send better to his sweetheart in sleeveless *camisa*. That's not the message for me.'

'How can you tell there wasn't some other which has miscarried? I'm almost sure there has been; else why should somebody have knocked at the door, and said so. The Americano left in charge of the house has told grandpa something about four men having come there the night after we left it. One may have been the messenger, the others going with him for company; and through his neglect, we've not got letters intended for us. Or, if they haven't written, it's because they were pressed for time. However, we shall know when we meet them at Cadiz.'

'Ah! when we meet them there, I'll demand an explanation from Eduardo. That shall I, and get it—or know the reason why.'

'He will give a good one, I warrant. There's been a miscarriage somehow. For hasn't there been mystery all round. Luckily, no fighting, as we feared, and have reason to rejoice. Neither anything seen or heard of your Californian chivalry! That's the strangest thing of all.'

'It is indeed strange,' rejoins Carmen, shewing emotion; 'I wonder what became of them. Nobody that we know has met either after that day, nor yet heard word of them.'

'Carmen, I believe one *has* heard of them.'

'Who?'

'Your father.'

'What makes you think so, *Iñez*?'

'Some words I overheard while he was conversing with the English sailor who's now in the ship with us. I'm almost certain there was something in Mr Crozier's letter that related to De Lara and Calderon. What it was, grandpapa seems desirous of keeping to himself, else he would have told us. We must endeavour to find it out from the sailor.'

'You're a cunning schemer, *sobrina*. I should never have thought of that. We shall try. Now I remember, Eduardo once saved this man's life. Wasn't it a noble daring deed? For all, I'm mad angry with him leaving me as he did; and shan't be pacified till he get upon his knees, and apologise for it. That he shall do at Cadiz.'

'To confess the truth, *tia*, I was a little spited myself at first. On reflection, I feel sure there's been some mischance, and we've been wronging them both. I shan't blame my darling till I see

him again. Then if he can't clear himself, oh, won't I?'

'You forgive too easily. I can't.'

'Yes, you can. Look at yonder hill. Recall the pleasant hour passed upon it, and you'll be lenient, as I am.'

Carmen obeys, and again turns her glance toward the spot sacred to sweet memories.

As she continues to gaze at it, the cloud lifts from her brow, replaced by a smile, that promises easy parlon to him who has offended her.

In silence the two stand, straining their eyes upon the far summit, till shore and sea become one—both blending into the purple of twilight.

'Adios, California!'

Land no longer in sight. The ship is *au large* on the ocean.

## CHEAP RAILWAY TRAVELLING.

PRODIGIOUS as were the advantages secured by railway travelling, cheapness was not at first a matter of serious consideration. Accommodation for what are called the masses did not enter into the calculations of the railway companies; perhaps because the masses had never yet shewn any disposition or ability to travel. In short, third-class travelling by rail came laggingly into use. Some companies refused to adopt it in any form; while others bent to it only when temporary or local competition appeared. When parliament insisted that, once a day at anyrate, passengers should be afforded the means of travelling at a penny a mile, in closed carriages, the companies obeyed the law grudgingly; they started their 'parliamentary trains' (as they were called) at inconvenient hours, adopted a tediously slow rate of speed, and shunted the train repeatedly, to allow the passage of faster trains. All this was most unbusiness-like, and proved disadvantageous to everybody, the shareholders of railway companies included. The error consisted in a real belief that third-class fares, and low fares generally, involved a grievous diminution of the companies' net profits, and should, if possible, be discouraged. Competition was the agency which taught railway directors better; not reckless competition at ridiculously low fares, to be followed by a return to high fares when the cabals and quarrels between the companies had subsided; but a reduction to be steadily maintained on two lines which accommodated two or more stations by different routes. It was a truth only gradually recognised by directors, that cheap fares *create* traffic, by tempting those to travel by rail who before did not travel at all; by tempting those to travel frequently who, previously, had made but few trips in the course of a year; and (in regard to merchandise) to encourage swift transit by rail, instead of slow transit by road or canal.

How the system has advanced in these characteristics, is known in a general way to most persons. Railway directors are not one whit more benevolent now than they were twenty or thirty years ago; but they are more experienced, and give a practical turn to the experience they have acquired. They have discovered that penny-a-milers are a very important set of customers, who are by no means to be pooh-poohed. This fact was recognised in a striking way by the Midland directors, two or three years ago, when they commenced the system of carrying third-class passengers by every

train, fast as well as slow, and over every part of their widely stretching network of railways. The other companies were much troubled by this innovation, which placed them on the horns of a dilemma: if they followed the example set to them, they apprehended a loss of receipts, by carrying the bulk of their passengers at third-class instead of second-class fares; if they did not follow the example, a probability arose that the daring innovator would take the leading place in the estimation of the public. This twofold perplexity has led to curious results in the diversity of plans adopted, as will be seen at the end of this paper.

The latest Report on these matters, presented by Captain Tyler to the Board of Trade, is full of interest, in relation to the proceedings down to the end of 1873. We pass over his marvellous details concerning our railway system, now extending over upwards of 16,082 miles, and costing, all things included, the stupendous sum of very nearly six hundred millions of pounds sterling. The point we direct attention to is the expansion of third-class accommodation on the lines generally, but, in particular, as regards the Midland Railway—so called because it lies midway from north to south between the Great Northern and the London and North-western. 'During a portion of 1872 and during 1873, the experiment of conveying third-class passengers in fast trains, initiated by the Midland Railway Company, and carried out in a great measure by the other principal companies, who felt compelled more or less to adopt a similar course, has now been more fully tried. The results of that experiment, not only upon the third-class traffic, but also upon the traffic of the other classes, are apparent. Different companies have no doubt been affected by it in different degrees; and it is a question how far the increase in the numbers and receipts from third-class passengers is altogether due to the greater facilities for fast travelling thus conferred upon them. Other causes which may be considered to have been in operation, with reference to the agricultural, manufacturing, and commercial prosperity of the country during the periods referred to, must also be borne in mind; but the general results of the experiment must be considered to be the desertion to a considerable extent of second-class for third-class carriages. The continued increase of first-class traffic tends to the conviction, that passengers desiring or requiring first-class accommodation do not object to the existing first-class fares. The decrease of second-class traffic indicates that the fares are too high for the advantages or accommodation afforded, relatively to the other classes; and, consequently, that the second-class fares might advantageously be reduced. The increase in the third-class traffic is encouraging, as shewing still further than in former years the elasticity and importance of that traffic. On the other hand, the experiment of conveying third-class passengers by fast non-stopping trains, as partially adopted, does not seem to have been entirely satisfactory, either to the railway companies generally, or to the passengers of higher classes travelling by express trains; as leading, where duplicate trains have not been run, to overcrowding, unpunctuality, and other inconveniences.'

Two passages in Captain Tyler's remarks have a bearing on the Midland Company's next bold venture, which was put in force on New-year's

Day 1875. The general result of the change made in 1872, that of greatly increasing, the third-class accommodation, has been 'the desertion to a considerable extent of second-class for third-class carriages.' This is precisely what the Midland directors say; the second-class carriages certainly are very much deserted, and a great weight of wood and iron has to be dragged along, with very few passengers to pay for the haulage. The companies carried 81,000,000 second-class passengers in 1871, but only 70,000,000 in 1873, notwithstanding the great increase in railway travelling generally in the two years; there were nearly as many second-class carriages employed, but eleven million fewer passengers in them. This is the reason assigned by the Midland for abolishing second-class altogether. A second remark is: 'The continued increase of first-class traffic tends to the conviction, that passengers desiring or requiring first-class accommodation do not object to the existing first-class fares.' This goes against the Midland scheme, and so far supports the protest made by the other companies; they all assert that first-class passengers do not object to twopence per mile for well-appointed carriages in fast trains; and that it is a gratuitous throwing away of money to carry well-to-do passengers at three-halfpence per mile. A further comment by Captain Tyler relates to the overcrowding and unpunctuality which result (or may result) from a great predominance of third-class travelling, and which would be distasteful to those who have paid first-class fares. This evil, we presume, could be obviated by providing a sufficiency of carriages, and a sufficient staff of active servants at the principal stations.

Matters will probably turn out thus: Those who have hitherto travelled first-class will continue so to do, and will benefit by any reduction of fare. Those who have hitherto travelled third-class will in like manner continue so to do, but with no material reduction of fare. Those who have hitherto travelled second-class will divide off into two parties, the minority going up to the first, the majority going down to the third. How the first-class folk will like to see the middle class come among them, remains to be seen; a curious subject is this of caste or social class, concerning which the companies can do no more than feel their way by degrees. For those who desire to be particularly exclusive, it would not be difficult to have a few *coupés* set apart at a higher charge per mile. The great object to be achieved is to lessen the number of empty or half-empty carriages that are dragged along uselessly with many of the trains.

The total effect of the new system cannot yet be estimated. The several companies have followed the lead of the Midland still more unwillingly and incompletely than in the former movement. The reduction of first-class fares from twopence to three-halfpence per mile is greatly disliked by them, as a gratuitous sacrifice of revenue; and it certainly is the case that very few first-class passengers have been in the habit of complaining of the rate hitherto adopted. Uniformity of system is quite destroyed just at present; 'chaos' may become 'cosmos' by degrees; but chaos assuredly reigns in the meantime. Very few of the companies adopt the Midland new system in full—namely, first-class at three-halfpence, *plus* third-class at a penny. Some adopt the two classes only, but make the first-class a little over three-halfpence, or the third-class

(except a few parliamentary trains) a little over a penny. Some have three classes, but charge only five farthings per mile for the second. Some adopt the Midland tariff between such stations only as are subject to competition, but charge the old fares on all other parts of their line. Lastly, some resolutely set their face against the whole innovation, and retain the three classes and the former rates of fare.

Since the above was written, the principal railway companies have reported on the traffic for the first half of the year 1875. The results, so far as they relate to recent changes, we now proceed to give.

The *Midland*, abandoning second-class traffic, carried fewer first-class passengers in the first half of 1875, than first and second class in the corresponding half of 1874; but this deficiency was more than made up by the increase in third-class. As a total, 840,000 more passengers were carried, and £50,000 more money taken in fares—an increase due in great part, however, to the opening of new portions of line. The average receipts per mile have remained nearly unchanged; the directors claim to have greatly benefited the public, without loss to the company.

The *London and North-western* 'have had to modify the first-class fares, in consequence of the Midland competition; but they have continued to run three classes of carriages, and experience convinces them that they are justified in this policy.' They have carried 100,000 more first-class passengers, and 254,000 more second-class; but as the fares have been lessened, the total money receipts have undergone no increase. The third-class remains nearly stationary, attributed to the migration of third-class into (cheap) second. The directors, without loudly complaining, are dissatisfied with the Midland policy.

The *Great Northern* carried 1,200,000 more third-class, and 180,000 more first-class passengers; but as there was a decline in the second, and as both first and second class fares have been lowered, the gross passenger receipts are only augmented by £12,000—barely equivalent to the length of new line opened. What the directors most regret is, having to lessen the first-class fare in order to keep on equal terms with the Midland.

The *Great Eastern* have adopted the strange course of charging three-halfpence per mile for third class (except by parliamentary trains), thus nullifying the value of the boon of 'third-class by every train;' and as the first and second class fares are also high (except where they compete with their neighbours), the public have little cause to be grateful to this company.

The *Great Western* have not lowered their fares, except to a few competing stations, nor put on third-class by every train. Third-class trains are, however, increased in number, with the result of inducing many second-class folk to travel by third—a tendency against which the directors complain strongly. They are 'quite satisfied that the Midland did wrong in abolishing second-class, and feel convinced that time will shew this to be the case.'

The *Manchester, Sheffield, and Lincolnshire* are perplexed and in doubt how far to imitate their bold neighbour, the Midland. The abolition of second-class, and the lessening of first-class fares to competing stations, have been followed by a dimi-

nution of receipts from passenger traffic, notwithstanding the opening of new portions of line.

The *Lancashire and Yorkshire*, 'after much consideration, have resolved not to imitate the Midland in abolishing second-class.' The directors note an increase in the number of passengers by that class, greater than in the number by first or by third, consequent probably on a slight lowering of fares; and third-class tickets are extensively issued throughout the day, though not by every train.

The *North-eastern, North British, Caledonian, Glasgow and South-western*, and other companies in the north, have made but little change in these matters, except at points where competition arises, or where through-tickets necessitate an equality of system with other companies. In other words, they have not been so immediately pressed upon by the Midland. When this last-named company opens for passenger traffic the new line from Settle to Carlisle next spring, we shall probably see considerable modifications in the details of Scotch traffic, to the advantage of the public.

The four principal companies south of the Thames, like the Scotch companies, have made fewer changes than those in the central parts of England. The *London and South-western* refuse to lower the first-class fares, and equally refuse to abandon second-class; they slightly increase the third-class accommodation, and report an augmentation of traffic. Nearly the same thing has occurred on the *Brighton, the Chatham and Dover*, and the *South-eastern*; the companies appear to gain rather than lose by moderately cultivating third-class traffic, but do not relish any lowering of fares by the other two classes. It is not certain how much of the additional traffic is due to the opening of new portions of line.

To sum up. It is evident from the above reports and comments, that the time has not yet come for estimating the full effects of the three great changes introduced by the Midland—the lowering of first-class fares, the abolition of second-class, and the carrying of third-class passengers by every train. The other companies speak reproachfully of the innovator; but it is left to the future to shew which are in the right. Meanwhile we may add a comment of our own. The advantages of *return tickets* have been curtailed by these changes; such tickets are still issued, but the Midland charge almost exactly double fares for them, and some of the other companies do the like. This is a withdrawal of advantages which lessens the interest of the public in the recent changes.

One word more. It appears to us that railway companies could do much for their own benefit, as well as for the encouragement of travellers, by issuing bundles of tickets to be used at convenience. In some parts of the United States, as we know by experience, railway tickets are sold in shops like any article of merchandise, and may be used at any time, by which arrangement people are not obliged to wait at crowded stations for the opening of wickets. Might not some plan of this kind be tried in England? We are aware that the North British Railway Company issues what are called 'Family or Guest Tickets.' Such tickets, however, are only issued to the holders of season-tickets. According to the official announcement, 'Holders of season-tickets to any station on the company's line to which the ordinary

first-class single-journey fare is three shillings or upwards, can purchase at one time six or more first-class return-tickets at a single fare and a quarter of the ordinary first-class fare, to be used by members of their families, or by guests visiting at their houses. These tickets are not transferable, and they must be used during the currency of the season-tickets in respect of which they have been issued.' Application for such tickets is made by filling up a printed form. The same company have the further arrangement of issuing lots of not fewer than twenty first-class return-tickets, or a number equivalent, to the value of not less than L.5. But there is this restriction, that these tickets shall be used exclusively for the family and friends of the person whose name they bear. They must likewise be used consecutively, according to number, beginning at the lowest. There may be other companies which offer to sell tickets on a similarly wholesale plan, and possibly free from the foregoing restrictions, some of which seem to be only calculated to defeat the object aimed at. A broad intelligible method of issuing return-tickets in bundles to be used at any time by anybody, is the boon specially required.

### S A L V A G E.

#### IN TWO CHAPTERS.—CHAPTER I.

IMAGINE London at three o'clock in the afternoon of a roasting day, the month August, and the aspect of Londoners savage.

Can a man be reasonably expected to feel amiable and benevolent who is obliged to remain in Town after the season is over? Every cab he sees bearing its happy freight to the stations, to be presently transferred to the seaside, seems, by some mocking and relentless fate, to bring to his parched and fevered senses a whiff of the salt sea-breeze, and to make him long the more for the unattainable; and it would appear as if the intense blinding heat, the pitiless scorching rays, had shrivelled up the heart of man, and dried the well-springs of his kindness and compassion. Wherefore at this hour stood the Honourable Denis Delmar, a youth of some twenty summers, on the steps of his father's mansion in Portland Place, and his face wore a sorrowful look and a gloomy. His father, Lord Delmar, had just refused the earnest suit of his only child, and, probably under the influence of the irritating weather, used strong language, and altogether conducted himself in a strictly parental, though decidedly annoying manner. Calling a hansom, the youth drove eastward, and stopping at the door of a used-up-looking house in Queen Square, Bloomsbury—that purlicu of decayed gentility and faded grandeur—discharged the cab, and entered the house. He made his way quickly up the staircase, and went into a drawing-room, where sat a young and beautiful girl; we say beautiful, for, though a heartless, critical old maid might have found fault with the irregularity of her features, yet the deep swimming brown eyes, and the bright ever-changeable expression of a happy face—a kaleidoscope of shifting humours, settling always into some new form of beauty—formed a picture, which, set as it was in a framework of wavy golden-brown hair, must have charmed every one else who saw her. No one could gaze on that fair fresh countenance and not admire; few could look on Alice Went-

wood, and not feel better for that look, and in her presence the moody brow of our hero that-is-to-be, relaxed.

'My little queen!' he said; and clasping her fairy form in his arms, he kissed her ardently, tenderly, and so long kept his lips pressed to hers, that she at last withdrew quickly, blushing from his glowing embrace; and the maid-servant, who, during its continuance, had been unable to withdraw her eye from the key-hole, caught a sad cold in that organ. Alice gazed for some time at the noble expressive countenance of her lover before speaking.

'Dear Denis, in the presence of their Queen, all the courtiers at least *look* amiable. You shall not frown so, dearest, but tell me what said and did Lord Delmar. Is he still inexorably deaf to your wishes. Speak to me, Den, and relieve my anxiety—there's a dear boy' (coaxingly).

'He said he would never consent to my marriage with—with—you. I said I would wed none but my darling; and he replied, that I might live a wealthy bachelor, or exist a wedded beggar.'

Alice Wentwood, *atut* nineteen, rose like a queen. 'Sir, it is as I feared, but your father's wishes shall be respected. *I will never marry you, without Lord Delmar's consent.* Heaven forbid that the one who loves you most truly, should be the one to cause your ruin! Leave me, Denis Delmar—leave me now! Return to your father; acknowledge that you have acted wrongly and hastily in loving your social inferior. Marry; forget me; and—God—send—you—may—be—happier—and—more—fortunate—in—your—next choice.' Her voice quavered and died away at the last words.

Amazed, and somewhat indignant, at this unexpected tirade, Denis gave her one mute look of reproach, turned, and laid his hand on the door-handle.

'Good-bye, Alice' (sternly). Pause. 'Good-bye, Alice' (softly). Pause. 'Good-bye, Alice' (huskily). No reply. He could not see her face now; it was turned from him, but the head lower than before. Once more he spoke: 'Alice, love, will you send me from you thus?'

A moment's hush, then she answered: 'Denis Delmar, your father's curse would rest upon me if I separated you from him. My darling, I have loved you too well, to bring shame to your family in my own person; so, fare-thee-well, Denis; good-bye for ever.'

Her voice quavered very slightly, but its tone was unyielding. For his sake, she compelled herself to be outwardly calm. She knew that one look, one motion of her fair hand, even one sob, would bring him to her feet for ever for weal or woe; but her pride and love were stronger than her selfishness and affection (four things, by the way, which are often mistaken for each other). And still he stood there; it was so hard to leave his life behind him, and to go out from that room dead to love for ever.

Presently, she turned, and command was in her voice: 'For the last time, Denis Delmar—your suit unsanctioned by your father—I say to you, farewell, farewell.'

Slowly and dejectedly he turned, and threw on her one look of agony as she stood there queenly immovable; then, passing out of the death-chamber of his hopes, he bowed his head, and went from her.

Passing down the stairs hastily, as he left the house, he heard a bell ring violently, then voices calling, but, absorbed in his own grief, he took no notice of this circumstance, but pursued his way gloomily, and with a heart burning with conflicting emotions. Arrived at home, he sought his father, and requested his permission to take the yacht, and set out at once for a cruise which should extend for at least six months.

Long and earnestly the old lord gazed on his son's face. 'Denis,' said he, 'I see you have returned to your duty and a right sense of your position. Is it not so?'

Denis could not speak; he bowed his head.

The other continued: 'I am satisfied with you. Henceforward, we will treat this foolish infatuation as if it had never been. You may start at once, if you please; the yacht lies at her moorings at Dover. For six months, you shall be your own master. Come back then to me as the heir of our house should come—competent to support its dignity, and knowing what he owes to his parents.'

In three hours from that time, the Honourable Denis Delmar was seated in an express train, whirling down to the seaside; and the book resting on his knees bore the title, *Not Wisely, but too Well*.

We cannot expect our readers to feel any interest in a person to whom they have not been previously introduced; the laws and regulations of society compel us to have a voucher of the respectability of a brother or sister pilgrim, before we can socially recognise his or her existence. How often it happens that a (moral) rascal requires the good offices of another miscreant in order to make him personally known to a third and greater ruffian.

Present company always excepted.

'Let us atone for our neglect, and introduce Miss Wentwood—Mr Gentlereader. Mr Gentlereader, this is Miss Wentwood.'

After you have talked commonplaces, and exhausted the weather—that never-failing *ragoût* of conversational cooks—we buttonhole you, and, leading you into a snug corner, let you in behind the scenes.

Alice, at the time you first saw her, was living in the house of a Mr Graham, a solicitor, and the legal adviser of Lord Delmar. Here our heroine was kept in trust, for her guardian had been an old and valued friend of her father's from boyhood. Later on, in the same regiment he and Alice's father had fought as brother-officers side by side, until at last Major Wentwood, succumbing to jungle-fever, confided with his last breath the care of his idolised and only daughter to his friend, who, unable at that time to leave India, had sent her home to Mr Graham—who, he well knew, would be kind to the orphan girl—until he himself could follow her. Here it was, then, that Denis first saw her; and, charmed with her manner, sought daily her companionship, and soon found that the perfection and grace of her body were only equalled by the natural beauty of her mind.

Mr Graham lived on but a small income, and in an unostentatious manner. Alice had never known what her father's circumstances were; but she guessed that, with the exception of a small annuity left her by an aunt, she was entirely dependent upon her guardian. Her mother had been dead many years.

And now, having effected an introduction, let us resume our narrative.

When Denis, despairing, took his bitter farewell of his love, and, as he imagined, his happiness for ever, and left the house, a violent peal at the bell was heard; the servant, hastening to the room, was heard to call loudly for assistance, and Mrs Graham, who happened to be at home, rushed up the stairs, and there, to her infinite consternation, found Miss Wentworth prostrate on the floor. Nature had prevailed over pride, and she had fainted. Raising her in their arms, they bore her to the open window, and speedily restored her to consciousness, and, alas, to misery! Poor Alice; it was her first *affaire du cœur*, and there was fierce strife in her breast. Love had thrown down the gauntlet to Self, and Nature was revenging her half-brother.

Presently Mr Graham came home, and sedulously this old man set himself to console, comfort, and revive the drooping and despairing heart. 'Make haste and get strong again, and well, my darling,' he said, 'and to-morrow, or the next day, we will take you down to Dover. Do not let your heart be cast down, for a little voice has whispered to me that all will yet be well.'

For two days and nights it had blown 'great guns' on the coast; the wind came roaring and howling over the sea, and dashed the spray in cataracts over rock and land, and the unceasing roaring waves tumbled over each other in their eagerness to beat and lash the shore, in unavailing fury. The fishermen, boatmen, and other water-rats gathered in knots on the beach, and ever and anon turning their keen and anxious glance in that quarter where lay the 'Goodwins,' shook their heads, and talked of death and salvage in a breath. Much chance was there of the former, though but little of the latter, unless the gale quickly moderated; for though all the life-boats were out, yet the relentless waves would spare little of the unhappy bark that should once drift on to those awful sands—gates to the mariners' Eternity.

A small group of sailors was standing near the end of the pier, gazing out into the darkness with anxious faces, for just before nightfall a large ship had appeared in the offing, firing guns of distress, and signalling for assistance; but the gale had since then increased, and the men were anxiously discussing the chances of her weathering out the storm.

'God give the lads soft sea-beds, for they'll not rest on a dry one again, gin the wind keeps this way.'

The speaker, an old gray-headed man, bared his head; he was alone in the world, having recently lost his only son, by the capsizing of a boat in rounding the pier-head. An all-wise Providence had seen fit to take the one sheep away to the place where there are already so many; but it seemed so hard to this old man, who, nevertheless, bowed his head like a forest oak to the will of the Almighty, and went out to endeavour to avert that grief from other hearts, that he felt so keenly himself. As he finished speaking, a flash shone far out at sea; a moment's pause, and the report of a gun came booming across the waters; then swiftly a rocket ascended, and it seemed to the observers like a messenger sent up to heaven to implore aid for perishing humanity; a second, and it burst impotent, and was gone. Again all was darkness and despair.

'Volunteers to go out with me to that ship!'

The startled crowd turned; in their midst stood a young man; his frame was sturdy and well knit,

and his athletic form, albeit wearing a look of aristocratic languor, shewed great power and strength, dormant, perhaps, but still there. His teeth were set, and his brow wore a look of settled melancholy, only his eyes glittered and burned with a strange fire, as again he uttered the words: 'Who volunteers to save that ship?'

A grim smile was on the faces of those men, and one answered: 'None but madmen.'

But the old man regarded him attentively, and awaited his answer. It came.

'Madman or not, I am going out to that ship, and I call for six volunteers to accompany me. If we succeed, salvage will repay them. If we fail, their families shall not want.'

A silence fell on the group. Then the old man said: 'What boat wilt thou go in, lad?'

'The life-boat of my yacht,' came the reply; 'and I tell you, old man, that I have been with her in weather little better than this, and here I am.' Then turning to the crowd: 'Now, twenty pounds down to every man who goes to make up my crew.'

The old man ranged himself by his side: 'Life be nowt to me, now my boy is gone; mebbe I shall follow him the quicker. Sir, I thank you; I make one.'

Then two of the yacht's crew stepped out; brave young fellows were they, sturdy and strong, and their example moved the crowd; and one by one came six others, of whom three were quickly selected.

A woman's voice rose above the storm, clear and shrill: 'Who be you to command our sons and husbands?' it asked. 'Mayhap some ne'er-do-well that you throw away your life like this.'

He turned grandly to that excited crowd. 'That is true: to me, it is worth nothing; yet, if I die, a father will be childless, an earldom soon vacant, and a girl will'—He broke off suddenly, and turned away: 'Men, we must hasten!' said he.

The old man advanced, and took his hand respectfully, yet tenderly, and wringing it heartily, the volunteers and their noble skipper made short preparation, and manned the boat.

The wind whistled and roared over the deep; the manes of the 'white horses' were torn from them, and flung in the faces of the breathless crowd, drenching them with the salt spray; and through the waves and the storm, the tempest and the spray, with the driving scud above, and the sailors' grave beneath, out into the black night went that frail boat on its mission of mercy.

Fearful was the danger, and dire the peril of the yacht's brave little boat; oftentimes had they all but given up hope, but a merciful Providence watched their gallant efforts for the rescue of their fellow-creatures. All that awful night had they laboured on through the darkness, their course guided only by the signals of the unhappy ship. They had steered so as to intercept her, as she was fast dragging her anchors. The old man at the helm, and the youth in front of him, sweeping his oar through the water with mighty strokes, faced each other; and so they toiled on in that fearful tempest; old age and youth for once equal in the race for the grave, and working out, in one single grand action, a noble end. When at length they had reached the ship, weary and faint with their unequal conflict, they quitted their boat one by one as they had an opportunity, and called to him who had steered them so bravely and so well

through the raging waves; but no answer was returned. After infinite labour, the boat was hoisted to the ship's side, and there, in the stern, supported by the tiller, sat the old man, his head on his breast, his soul with his God. The brave spirit had flown to rejoin his boy, and the faithful heart had ceased to beat in the supreme moment of victory.

During the night, several of the ship's crew had been washed overboard in a tremendous squall, and the survivors were far too exhausted by their protracted struggle to work the ship. They had endeavoured, as a last resource, to anchor, but, as we have seen, the attempt was futile. It was just at the time they had resigned themselves to apparently inevitable destruction, that the encouraging shouts of the boat's crew reached their ears, and they saw, with frantic joy, a fresh chance of life. No sooner had Denis and his men boarded, than they set to work to clear away the wreck of the fallen rigging; and their example inspired the ship's crew to such an extent, that between them they managed to put the ship about and stand out to sea. They had scarcely lost the sound of the roaring breakers when the gale commenced to moderate; the wind changed; and about an hour before morning they were again enabled to make for the shore. All this is easy enough to read about, but it required no small amount of seamanship and hardihood to bring the vessel out from that fearful peril, 'a lee shore.' Truly, it is a fearful thing to fight in the darkness against raging seas and roaring winds; humanity seems so small, and God so great and near.

Throughout the night, the storm continued to rage; but about an hour before dawn, the wind lulled; the gale had blown itself out; the sea, however, still continued fearfully high, and broke in giant rollers on the beach.

With the first dawn of morning, the eyes of those on shore were strained to catch a glimpse of the ship. The morning was dull and misty, and for some time little could be seen of the sea to windward; but presently the sky became clearer, was streaked with silver; the hues deepened, the glorious sun shone out, and its first beams dispelling the mist, ushered in a cloudless day, such as is often seen after a great storm upon the coast. As the fog rose up, like the curtain from a stage, there, not half a mile from the land, lay the ship. She was partially dismantled, but steadily making her way into port with what sail she could carry. In less than an hour, she was lying under the lee of the pier.

Truly, nothing succeeds like success. The ship was saved. Denis and his plucky crew had succeeded; and mothers held up their babes to look at the hero. Had he failed, he would have been 'a murderer;' women would have cursed him who had robbed them of their supporters, and would have taught their children to execrate his memory. Arrived at the hotel, Denis called one of his crew, and directed him to pay the men the money promised, dividing the old man's share among them; moreover, he enrolled the three natives there and then on the books of the yacht, and shook hands with them, thanking them in a few brief but hearty words for their aid and bravery. Then the men cheered, and took their leave, and being seized upon by the population, with yells and acclamations, were borne in triumph to their own homes.

Denis had brought ashore an elderly companion, whom he conducted to his apartments, where he ordered breakfast and dry clothing; and then set himself modestly to refuse all thanks and praise from the other. No: his life was almost valueless to him; he had risked what was only of little worth; he deserved no praise, and would accept none. This was the way he talked. Then the other drew from him by degrees his whole story; and, by his kind and genial manner, thawed the ice in which the cold winds of adversity had inclosed his heart, and won him to relate how it came about that a young man—titled, rich, and handsome—should discover so early the nothingness of life and its earthly pleasures. He undertook to shew him the impossibility of existing without some object in the future. Youth is ever prone to confidences, and Denis felt a kindness for the man whose life he had saved, and so, to his kind and sympathising ear, he poured forth the longing utterances of his heart; and told his tale with a simple and manly dignity that won upon the heart of his attentive auditor, and when he had finished, the other spoke: 'Now that you have fulfilled my request, and proved to me that, being a gentleman yourself, you know another by intuition, I will return your confidence, my dear boy. The ship you saved by your noble action and example was bringing me from the East Indies, and had on board the proceeds of the sale of my estates there, mostly in specie and produce. You have thus, by your intrepid conduct, been the means of sparing me a great loss. And now, pray, remember, that as yet I am ignorant of the name of my preserver.'

'Men call me the Honourable Denis Delmar,' was the bitter reply.

'Denis Delmar!' exclaimed the other, as he sprang from his chair, which he grasped with a convulsed movement. Denis approached him in surprise; he feared he was about to fall. The old man regarded him steadfastly for a moment, then, with a look of unutterable love, he pressed the youth to his heart—fondly and passionately; then, tearing himself from his arms, he rushed from the room, his form agitated visibly by the emotion he strove so hard to conceal. To attempt to describe Denis's state by the word 'mystified,' is useless. He sat and stared at the door vacantly. Was there a curse in his name working always for evil? It had ruined the happiness of Alice and himself; and even now it was marring what satisfaction his own conscience felt at his late meritorious deed. Presently, an attendant entered the room, bearing a note. It ran thus:

DEAR FRIEND—Pardon the eccentricity of an old man, to whom life is yet so sweet that he sheds tears at the name of its saviour. My nerves were much shaken by the late events, and I felt overpowered by the sudden remembrance of all I owed to you. Pray, forgive me, and from this moment, I entreat you, look upon me as your friend for life, to which life I trust before long to reconcile you.

WILLIAM GIMP.

To the Honourable Denis Delmar.

Having read this through again, our hero felt very dissatisfied with the first part of it; there was a want of sincerity, he thought, about the old man's excuse for his emotion, although the explanation seemed reasonable enough. Meditating upon this, he rose from his chair, turned to the window,

and looked out listlessly into the street. Suddenly, he gave a cry of surprise. There, seated in a hired carriage passing the door, sat Alice, his Alice once, but oh! how changed in appearance. 'What suffering have I caused thee, my darling!' exclaimed, in anguish, the man who had pulled his oar silently through the night of peril. 'God forgive me!' cried, in despair, he who had faced death, himself unmoved. Then moans of pain were wrung from this strange compound of strength and weakness, and in the agony of his grief, the insulter of death sunk into a chair as he cried aloud: 'Alice, Alice! O my love, I thought I was not cared for!' He covered his face with his hands; the excitement of the past night over, reaction set in, and the hot tears trickled from between his fingers, though he hated himself for the weakness. Suddenly, he started up. 'I will see her again,' he urged passionately, 'be the consequences what they may. She is ill, and I am the cause; perhaps she will die. That shall not be. I go to save, at the expense of my word, two deaths from resting on my father's conscience. I will track her home. I will see her, and if she *does* love me, my father *shall* consent to our union.' The latter part of this grandiose speech was uttered to the winds, as Denis sped along after the carriage, which was still in sight; he followed it closely, saw it stop, and his darling assisted to alight; she entered a house, and the door closed. Allowing a reasonable time to elapse, he walked up to it, and knocking, told the servant who replied to his imperative summons, that a gentleman desired a few minutes' speech with Miss Wentwood on important business. He was shewn up to the drawing-room; the door opened to admit him, closed again, and once more he stood in the presence of Alice. One glance of recognition she gave, and then the room grew dark, the floor rose up, and she would have fallen, had he not sprung forward and supported her in his arms. As she felt his embrace, and his warm breath on her cheek, she slightly revived, and gently gliding from his arms, sank upon a couch.

## THE PENITENT'S LIGHTHOUSE.

A LEGEND FROM THE FRENCH.

AT about three miles and a half to the west of Rochelle is situated a dirty and miserable village called Lalen. There are only a few fishermen there. The coast is barren and inhospitable. The sea shuts in its white belt of shingles, divided from place to place by immense rocks; and when it is stormy, you can hear the distant rumbling of the 'Mou de Monnusson,' an immense funnel, which sucks up the fishing-boats that approach too near it. At low-tide, the women go and pick up shells among the sea-wrack, whilst the men are busy in the fields. The fishermen are some of them stationed at St Martin de Ré; others at La Rochelle, that old Huguenot port, fortified by towers and ramparts. Along the coast are vast marshes, overgrown with mushrooms, and bordered by thyme. I started one morning in the month of September, before sunrise, with Captain Tailhades. We had spent the night at Portneuf, where Rear-admiral Bourdè had entertained us, and at dawn we had left his hospitable house, with our guns on our shoulders, our game-bags, and our pipes. The first rays of the sun dissipated the fog, and we saw the sparkling ocean. The islands of Ré and

Oléron were visible on the horizon like two black spots, and some sloops were tacking about, their sails spread to enter La Rochelle. After five hours of a painful march, we found ourselves on the coast of La Repentie, which is the most barren part of that arid shore.

'Now,' said Tailhades, 'let us try to find out where we are. Here is the Saut du Bouc; the coast-guard's hut ought to be over there; and since we are the strongest, we will make a raid on that solitary official's breakfast. Did I not say so? Do you not see the curling smoke? Let us hear to the right; we shall get a breakfast in that direction.'

The coast-guard received us with open arms, and having given our dogs an immense basin of soup, we did honour to the promiscuous breakfast. If I spend so much time in bringing before my readers the legend of the 'Repentie,' it is that I thought it indispensable to transport them to the place where it was related to me; so that they may forgive its simplicity on account of its truth, for I did not invent it.

I will now let the coast-guard speak.

'Before they had built the two lighthouses which shine at night like two stars between Oléron and Ré, you might have seen, on the top of the Roche du Bouc, a post strengthened with iron clamps, and surmounted by an enormous lantern. Every evening the coast-guard lighted it, and the boats that came up to the rock turned away when they perceived the light. Worthy Rébard, whose age no one knows, has often told me about the coast-guard Kernan, who spent the greater part of his life contemplating the lantern, and people said he was in love with it. The lantern, at all events, was always bright and in good condition. In stormy weather, when the sky was black and thundery, when the broken shingles rolled like thunder, it was visible at the end of the post; and the sailors, who thanked Heaven when they had escaped the reefs, blessed Kernan a little in their hearts. He was the only one who loved and protected the lantern, for it had many enemies. All the wreckers on the coast hated it. Formerly, a storm was a good thing for them, and after a night of misery to those at sea, they snatched up all the riches that were thrown up on the coast. It was a devilish trade; but amidst the wails there were often rich finds, and the lantern had ruined them. They had attempted to break the lantern and to throw down the post; but Kernan declared he would shoot any one he found attempting such a thing again. Amongst those the lantern had beggared was an old woman called La Mouette (the sea-gull), but nevertheless, she ought to have had pity upon others, for her son, a brave sailor, was at sea. He was twenty years old, and called Jack, whom every one in Lalen loved, because of his good heart.

'The season had been fine that year, and a number of the wreckers had gone inland to seek work. La Mouette blasphemed from morning till night, and one day, threatening the lantern, she said: "Infernal lantern, they have placed you there to ruin people; but that must be put an end to."

"You are very wicked, La Mouette," Kernan answered; "and God will punish you."

'It was at the time of the equinoctial gales. The sea found its bed too narrow. One night, the waves, like giants escaped from prison, rose up towards the sky; the wind howled like a guilty spirit; and

signals of distress were heard at sea. Kernan filled his lantern with the best oil he had, he put in a fresh wick, and when he saw the beneficent light shedding its rays round the rock, he went to bed, praying God for those who were in danger.

'La Mouette had watched his proceedings, and when he was gone, she climbed the rock in her turn. By dint of throwing stones, she had succeeded in breaking one of the sides of the lantern, so that the wind and rain rushed in and put out the light. At sea the signals of distress were redoubled, but at daybreak, Kernan, to his dismay, found his lantern broken.

'La Mouette on her side ran to the shore. It was covered with fragments of all kinds; but there were also some dead bodies. She ran from one to the other, pulling off the rings, turning out the pockets. But suddenly she grew pale; she stumbled, and then fell on her knees on the white stones. Her eyes were blood-shot; she turned one body over and over; she put her hand to the heart; she kissed it, crying like a mad woman, for she had recognised her son—her son Jack! She carried the body away, and brought it to her hut. There she wrapped it in warm linen, and called her boy by name, imploring him to answer her. After that day, she never left her cottage. She remained like a statue of Grief, seated night and day on a stone.

'Some kind neighbours gave her some food. The curé of Lalen came to see her; and she prayed and cried so much, that people came from miles round to see her. One morning—so they say—she was found dead on her stone. They wished to carry her away, but nobody could succeed. The water that dropped from the rock had petrified the old woman. She was there, sad and pale, like a statue of Grief. And as people had often bestowed money upon her, the curé of Lalen, according to La Mouette's wish, had another beacon put instead of Kernan's lantern. It is to this day called "The Penitent's Lighthouse."

#### LOVE'S WHISPER.

Go, heart of mine, and hasten to my Love;  
Tell her I mourn throughout the slow, sad hours,  
And that I wander through forsaken bowers  
Like some disconsolate and widowed dove,  
Who, being once forsaken of her mate,  
Doth wander ever after desolate.

Go, heart of mine, and tremble in her breast;  
Tell her that I am like the winds that scour  
O'er hill and dale, that leafy woods deflower,  
And meadows many-hued, yet find no rest,  
But making moan which never doth abate,  
Do wander up and down disconsolate.

Go, heart of mine, and whisper in her ear  
That I am like a tree no longer green,  
Where Winter's barrenness may be foreseen  
In branch and bough, by Autumn's touch made sere;  
And like the leaves which rough winds violate,  
The days from off my life drop desolate.

And if that move her not, go, kiss each lip,  
And tell her that I can no longer live,  
Unless she come again to me, and give  
Her sweet and ever-constant fellowship.  
And from her lips thou shalt not separate  
Until she swear to be compassionate.

## PILCHARD-DRIVING.

THE summer and autumn months are a busy time among Cornish fishermen, who have the three separate harvests of mackerel, herring, and pilchards to garner in quick succession. Of these fish, the pilchard is the least well known, as it is the least general in its distribution, being confined almost solely to the waters of Cornwall. The pilchard is, indeed, to be found in abundance off the coasts of Ireland, but there the fishery is almost entirely neglected. In Cornwall, on the other hand, the pilchard season is depended on by the fishermen for a large portion of their yearly earnings; and hundreds of boats and hundreds of miles of nets are nightly employed, during the latter part of the year, in pursuit of these fish.

A very pretty sight it is to watch the fishing fleet disperse itself over the broad expanse of St Ives' Bay or Mount's Bay at the close of the day. The setting sun lights up the bold rocky coast with a glory which only its rays can impart; and the vessels, with their two brown sails set, stand out in sharp relief against the shining surface of the water, in which the rosy glow of the sky is reflected and repeated with fresh intensity.

But a prettier sight still is that obtained from on board one of these boats. Slowly, as the evening breeze carries us away from port, and the hills recede in the distance, the sun dips towards the horizon, leaving a long bright streak across the surface of the sea. We watch his waning glory with mingled feelings of pleasure and regret—of regret, that so bright a scene so soon should pass away, that such gorgeous effects of colour should be so transient; but of pleasure in the knowledge that the gray clouds which succeed the rosy, purple mass are better suited for the work we have in hand; for it is not until the after-glow of the beautiful sunset has toned down into sober tints, that we can set our nets to any advantage.

There are few pleasanter ways of spending a summer's night than in 'driving' for pilchards, as it is called. There are two methods of catching

this fish, for which different kinds of nets are employed—namely, 'seine-nets' and 'drift-nets.' The former can be used only in shallow water, when they are 'shot' in a circle round the shoal of fish, which are thereby inclosed, and can be kept alive till the seine is emptied of its contents by means of smaller nets. These nets are used both by day and night, whenever a shoal of fish is seen sufficiently near the shore; but drift-nets can only be employed at night. They have a mesh of about half an inch from knot to knot, or 'six score to the yard,' and often measure as much as 'eighteen score deep,' or three yards wide. It is no uncommon thing for a pilchard-boat to shoot more than a mile of this netting at once. Fancy, over seventy-six million meshes, each capable of holding one pilchard, forming one continuous trap for the unwary fish!

A peculiarity of the pilchard is, that it swims close to the surface; and, as a shoal is 'heading' towards the shore, it can be plainly seen a long distance off, causing the surface of the water to darken with the compact mass. Gradually approaching the shoal, one can distinguish the glittering sides of the fish, as they jump and flutter about on the top of the water, causing quite a commotion, and a perceptible sound with their quick movements. Stamp with the foot at the bottom of the boat, and they disappear in a moment, striking downward, to rise again a few minutes after.

After sunset, when the boat finds itself in the midst of shoals of fish like this, it is time to shoot the nets. Two men, one at the head-rope, the other at the foot, pay them out, hand over hand. Every few seconds a splash in the water betokens the casting overboard of one of the larger buoys, which, alternating with the smaller floats, are attached to the nets. By the time the paying-out is accomplished, darkness has come on, and we wait awhile for the fish to strike the wall of netting placed in their path. A dark, moonless night is best suited for fishing; but if the water is in that curious phosphorescent state known among fishermen as 'burning,' which is often the case on

the darkest nights, the scene is one of extraordinary beauty. Every break in the surface of the water, whether caused by a wave, by the motion of the boat, or by the splashing of the net-floats, is illumined by a lovely glow of phosphorescent light, which gives the sea the appearance of being a mass of liquid fire. The net, hanging deep below the surface in a perfectly upright position, can be distinctly seen, and the boat itself seems set in molten silver.

At our mast-head a light is hung, to warn approaching vessels that we are made fast to our net. All around may be seen, dancing on the waters, the lights of one or two hundred more boats, with here and there the red or green lamp of some big ship bound on her way to some distant port, or returning home with the riches of foreign lands. Farther off still are the lamps burning on shore, awakening thoughts of the old times, when the false beacon of the Cornish wrecker was raised on high, to lure vessels to destruction. Happily, better days have dawned, and none are more eager to man the rescuing life-boat in aid of the shipwrecked sailor than the Cornish fishermen. The wrecker's beacon has given place to the danger signal of the lighthouse, keeping watch and guard day and night over the hidden dangers of the deep. Yonder, to the right, is the warning light of the Wolf Rock Light, alternately flashing red and yellow; while on the opposite side is the bright fixed double light of the celebrated Lizard Lighthouse, generally the last point of English land seen by the outward-bound crew, and the first spot recognised on their return.

Amid such a scene do we wait for the 'school' to strike the net. Overhead, the gulls are screaming and flapping their long wings, darting down every now and then into the water, as the unwary fish appear within their reach. The light attracts them to the boat, and they flit suddenly by, with a shrill cry, and off into the darkness like some ghost or spirit called by a second Ariel from the 'vasty deep.' And yet their presence is a good omen, denoting the existence of plenty of fish in the immediate neighbourhood; and, encouraged by this, the master soon gives the signal to haul in the net. It may not be amiss to remark that the sea-gull is the fisherman's friend everywhere; the presence of these birds in flocks over any particular spot on the sea denoting, with all but unvarying accuracy, the presence of fish. In many places indeed, the fisherman's movements mainly depend upon those of the gulls, which, hovering above or diving swiftly down, point to the welcome shoal.

Now our boat is a scene of busy activity. Slowly at first, but more quickly presently, the fish fall out of the net as it is hauled in, hand over hand, by the strong arms of the excited but steady fishermen. They fall on the deck with a flap and a rattle, which denotes that though they have been hung by the gills in the fine meshes of the net, they are still alive and ready to struggle for liberty. Soon, however, they lie motionless and dead. Hardly any fish dies more quickly than the pilchard, when taken out of the water.

As the catch comes pouring into the boat, the fish, reflecting the light from our lamp, present an appearance which no one can conceive by merely observing a fish in the fishmonger's shop, and which no painter, not even Mr Rolfe, the 'Land-

seer of Fishes,' could hope to imitate. Their scales are of lovely opalescent tints, barred with stripes of green, blue, and violet, which shine with a brilliancy and yet a softness which no gems, no pearls, could produce. To compare them to the most exquisite work of the jeweller's art is to give but a faint idea of the splendour of the colouring.

In an hour's time our mile or more of netting, with its living, struggling load of fishes, is hauled in and emptied. On a suitable night such a net will capture from eight to twelve or fifteen thousand fish. On such a night as we have described, when the fish can easily see the net in the water, six thousand fish is considered a good catch. They are nearly all pilchards; here and there is a stray pollock or a scad, but so closely do the pilchards swim together in the sea, that other kinds of fish are very rarely met with in a shoal. The fishermen even affirm that they actually raise the temperature of the water in the particular locality in which they are congregated together.

Night after night hundreds of boats go out in search of the pilchards, and yet every year the fish are in as countless millions as ever. They are principally used for export to Italy, after being salted and packed in barrels; and for home consumption in Cornwall, cured in vinegar, &c. Hundreds of tons are used for manure. But a new trade has recently been established in Cornwall, which will utilise vast quantities of these fish—namely, the preparation of pilchards as sardines, in oil. The Cornish Sardine Company, of Falmouth, has just been formed for the purpose of making 'Cornish sardines;' and as it is generally admitted that the pilchard and the sardine are one and the same fish, the trade will probably be a very successful one. Anybody, however, can buy the Cornish sardines, which will, no doubt, be preferred by Englishmen to the foreign production; but, as it is not everybody who can see the fish actually caught, we have given the above sketch of a night's pilchard-driving.

## THE FLAG OF DISTRESS.

CHAPTER XXXV.—A TATTOO THAT NEEDS  
RETOUCHING.

THE great Pacific current in many respects resembles the Gulf Stream of the Atlantic. Passing eastward under the Aleutian Archipelago, it impinges upon the American continent, by Vancouver's Island; thence setting southward, along the Californian coast, curves round horse-shoe shape, and strikes back for the centre of the South Sea, sweeping on past the Sandwich Isles. By this disposition, a ship bound from San Francisco for Honolulu has the flow in her favour; and if the wind be also favourable, she will make fast way. As chance has it, both are propitious to the *Crusader*; and the war-ship standing for the Sandwich Islands will likely reach them after an incredibly short voyage. There are two individuals on board of her who wish it to be so; counting every day, almost every hour, of her course. Not that they have any desire to visit the dominions of King Kamekameha, or expect pleasure there. On the contrary, if left to themselves, the *Crusader's* stay in the harbour of Honolulu would

not last longer than necessary to procure a boat-load of bananas, and replenish her hen-coops with fat Kanaka fowls.

It is scarce necessary to say that they who are thus indifferent to the delights of Owyhee are the late-made lieutenant, Crozier, and the midshipman, Cadwallader. The bronzed Hawaiian beauties will have small attraction for them. Not the slightest danger of either yielding to the blandishments oft lavishly bestowed upon sailors by these seductive damsels of the Southern Sea. For the hearts of both are yet thrilling with the remembrance of smiles vouchsafed them by other daughters of the sunny south, of a far different race—thrilling, too, with the anticipation of again basking in these smiles under the sky of Andalusia.

It needs hope—all they can command—to cheer them. Not because the time is long, and the place distant. Sailors are accustomed to long separation from those they love, and so habituated to patience. It is no particular uneasiness of this kind which shadows their brows, and makes every mile of the voyage seem a league. Nor are their spirits clouded by any reflections on that which vexed them just before leaving San Francisco. If they have any feelings about it, they are rather those of repentance for suspicions, which both believe to have been as unfounded as unworthy. What troubles them now—for they are troubled—has nought to do with that. Nor is it any doubt as to the loyalty of their *fiancées*, but fear for their safety. It is not well defined, but like some dream which haunts them; at times so slight as to cause little concern, at other times filling them with anxiety. But in whatever degree felt, it always assumes the same shape; two figures conspicuous in it, besides those of their betrothed sweethearts—two faces of evil omen, one that of Calderon, the other De Lara's. What the young officers saw of these men, and what more they learnt of them before leaving San Francisco, makes natural their misgivings, and justifies their fears. Something seems to whisper them that there is danger to be dreaded from the gamblers—desperadoes as they have shewn themselves—that through them some eventuality may arise, affecting the future of Carmen Montijo and Inez Alvarez, so as to prevent their escape from California. Escape! Yes; that is the word Messrs Crozier and Cadwallader make use of in their conversation on the subject—the form in which their fear presents itself.

Before reaching the Sandwich Islands, they receive a scrap of intelligence which in some respect cheers them. It has become known to the *Crusader's* crew that the frigate is to make but short stay there—will not even enter the harbour of Honolulu. The commission intrusted to her captain is of no very important nature. He is simply to leave an official despatch, with some commands for the British consul; after which head round again, and straight for Panama.

'Good news; isn't it, Ned?' says Cadwallader to his senior, as the two on watch together stand conversing. 'With the quick time we've made from Frisco, as the Yankees call it, and no delay to speak of in the Sandwiches, we ought to get to the Isthmus as soon as the Chilean ship.'

'True; but it will a good deal depend on the time the Chilean ship leaves San Francisco. No doubt she'd have great difficulty in getting a suffi-

cient number of hands. Blew told you there were but the captain and himself!'

'Only they; and the cook, an old darkey—a runaway slave, he said. Besides a brace of great red baboons—orange. That was the whole of her crew, by last report! Well; in one way we ought to be glad she's so short,' continues the midshipman. 'It may give us the chance of reaching Panama before her; and, as the frigate's destined to put into that port, we may meet the dear girls again sooner than we expected.'

'I hope and trust we shall. I'd give a thousand pounds to be sure of it. It would lift a load off my mind—the heaviest I ever had on it.'

'Off mine too. But even if we don't reach Panama before them, we'll hear whether they've passed through there. If they have, that'll set things right enough. We'll then know they're safe, and will be so—*Hasta Cuidéz*.'

'It seems a good omen,' says Crozier, reflectingly, 'that we are not to be delayed at the islands.'

'It does,' rejoins Cadwallader; 'though, but for the other thing, I'd liked it better if we were to stay there—only for a day or two.'

'For what reason?'

'There!' says the midshipman, pulling up his shirt-sleeve, and laying bare his arm to the elbow. 'Look at that, lieutenant!'

The lieutenant looks, and sees upon the skin, white as alabaster, a bit of tattooing. It is the figure of a young girl, somewhat scantily robed, with long streaming tresses: hair, contour, countenance, everything done in the deepest indigo.

'Some old sweetheart?' suggests Crozier.

'It is.'

'But *she* can't be a Sandwich Island belle. You've never been there?'

'No, she isn't. She's a little Chileña, whose acquaintance I made last spring, while we lay at Valparaiso. Grummet, the cutter's coxswain, did the tattoo for me, as we came up the Pacific. He hadn't quite time to finish it, as you see. There was to be a picture of the Chilean flag over her head, and underneath, the girl's name, or initials. I'm now glad they didn't go in.'

'But what the deuce has all this to do with the Sandwich Islands?'

'Only, that I intended to have the thing taken out there. Grummet tells me he can't do it, but that the Kanakas can. He says they've got some trick for extracting the stain, without scarring the skin, or only very slightly.'

'But why should you care about removing it? I acknowledge tattooing is not nice on the epidermis of a gentleman; and I've met scores, like yourself, sorry for having submitted to it. After all, what does it signify? Nobody need ever see it, unless you wish them to.'

'There's where you mistake. Somebody *might* see it, without my wishing—sure to see it, if ever I get'—

'What?'

'Spliced.'

'Ah! Inez?'

'Yes; Inez. Now you understand why I'd like to spend a day or two among the South Sea Islanders. If I can't get the thing taken out, I'll be in a dilemma. I know Inez would be indulgent in a good many ways; but when she sees that blue image on my arm, she'll look black

enough. And what am I to say about it? I told her she was the first sweetheart I ever had; as you know, Ned, a little bit of a fib. Only a white one; for the Chilena was only a mere fancy, gone out of my mind long ago, as, no doubt, I am out of hers. The question is, how's her picture to be got out of my skin? I'd give something to know.'

'If that's all your trouble, you needn't be at any expense—except what you may tip old Grummet. You say he has not completed the portrait of your Chilena. That's plain enough, looking at the shortness of her skirts. Now let him go on, and lengthen them a little. Then finish by putting a Spanish flag over her head, instead of the Chilian, as you intended, and underneath, the initials "I. A." With that on your arm, you may safely shew it at Cadiz.'

'A splendid idea! The very thing! The only difficulty is, that this picture of the Chilian girl isn't anything like as good-looking as Inez. Besides, it would never pass for her portrait.'

'Let me see. I'm not so sure about that. I think with a few more touches it will stand well enough for your Andalusian. Grummet's given her all the wealth of hair you're so constantly bragging about. The only poverty's in that petticoat; but if you get the skirt stretched a bit, that will remedy it. You want sleeves, too, to make her a lady. Then set a tall tortoise-shell comb upon her crown, with a spread of lace over it, hanging down below the shoulders—the mantilla—and you'll make as good an Andalusian of her as is Inez herself.'

'By Jove! you're right; it can be done. The bit added to the skirt will look like a flounced border. The Spanish ladies have such on their dresses. I've seen them. And a fan—they have that too. She must have one.'

'By all means, give her a fan. And as you're doubtful about the likeness, let it be done so as to cover her face—at least the lower half of it; that will be just as they carry it. You can hide that nose, which is a trifle too snub for the Andalusian. The eyes appear good enough.'

'The Chilena had splendid eyes!'

'Of course, or she wouldn't have her portrait there. But how did your artist know that? Has he ever seen the original?'

'No; I described her to him; and he's acquainted with the costume the Chilian girls wear. He's seen plenty of such. I told him to make the face a nice oval, with a small mouth, and pretty pouting lips; then to give her great big eyes. You see he's done all that.'

'He has, certainly.'

'About the feet? They'll do, won't they? They're small enough, I should say.'

'Quite small enough; and those ankles are perfection. They ought to satisfy your Andalusian—almost flatter her.'

'Flatter her! I should think not. They might your Biscayan, with her big feet; but not Inez; who's got the tiniest little understandings I ever saw on a woman—tall as she is.'

'Stuff!' scornfully retorts Crozier; 'that's a grand mistake people make about small feet. It's not the size, but the shape, that's to be admired. They should be in proportion to the rest of the body; otherwise, they're a monstrosity, as among the Chinese, for instance. And as for small feet

in men, about which the French pride and pinch themselves, why, every tailor's got that.'

'Ha, ha, ha!' laughs the young Welshman. 'A treatise on Orthopedia, or whatever it's called. Well, I shall let the Chilena's feet stand, with the ankles too, and get Grummet to add on the rest.'

'What if your Chilena should chance to set eyes on the improved portrait? Remember we're to call at Valparaiso!'

'I never thought of that.'

'If you should meet her, you'll do well to keep your shirt-sleeves down, or you may get the picture scratched—your cheeks along with it.'

'Bah! there's no danger of that. I don't expect ever to see that girl again—don't intend to. It wouldn't be fair, after giving that engagement ring to Inez. If we do put into Valparaiso, I'll stay aboard all the time the frigate's in port. That will insure against any'—

'Land, ho!'

Their dialogue is interrupted. The look-out, on the masthead, has sighted Mauna-Loa.

#### CHAPTER XXXVI.—A CREW THAT MEANS MUTINY.

A ship sailing down the Pacific, on the line of longitude 125° W. Technically speaking, not a ship, but a barque, as may be told by her mizzen-sails, set fore and aft.

Of all craft encountered on the ocean, there is none so symmetrically beautiful as the barque. Just as the name looks well on the page of poetry and romance, so is the reality itself on the surface of the sea. The sight is simply perfection. And about the vessel in question another graceful peculiarity is observable: her masts are of the special kind called *polacca*—in one piece from step to truck.

Such vessels are common enough in the Mediterranean, and not rare in Spanish-American ports. They may be seen at Monte Video, Buenos Ayres, and Valparaiso, to which last this barque belongs. For she is Chilian built; her tall tapering masts made of trees from the ancient forests of Araucania. Painted upon the stern is the name, *El Condor*; for she is the craft commanded by Captain Antonio Lantanas. This may seem strange. In the harbour of San Francisco the *Condor* was a ship. How can she now be a barque? The answer is easy, as has been the transformation; and a word will explain it. For the working of her sails, a barque requires fewer hands than a ship. Finding himself with an incomplete crew, Captain Lantanas resorted to a stratagem, common in such cases, and converted his vessel accordingly. The conversion was effected on the day before leaving San Francisco; so that the *Condor*, entering the Golden Gate a ship, stood out of it a barque. As this she is now on the ocean, sailing southward along the line of longitude 125° W.

On the usual track taken by sailing-vessels between Upper California and the Isthmus, she has westered, to get well clear of the coast, and catch the regular winds, that, centuries ago, wafted the spice-laden Spanish galleons from the Philippines to Acapulco. A steamer would hug the shore, keeping the brown barren mountains of Lower California in view. Instead, the *Condor* has sheered wide from the land; and, in

all probability, will not again sight it till she begins to bear up for the Bay of Panama.

It is the middle watch of the night—the first after leaving San Francisco. Eight bells have sounded, and the chief-mate is in charge, the second having turned in, along with the division of crew allotted to him. The sea is tranquil, the breeze light, blowing from the desired quarter, so that there is nothing to call for any unusual vigilance. True, the night is dark, but without portent of storm. It is, as Harry Blew knows, only a thick rain-cloud, such as often shadows this part of the Pacific. But the darkness need not be dreaded. They are in too low a latitude to encounter icebergs; and upon the wide waters of the South Sea there is not much danger of collision with ships. Notwithstanding these reasons for feeling secure, the chief officer of the *Condor* paces her decks with a brow clouded as the sky over his head, while the glance of his eye betrays anxiety of no ordinary kind. It cannot be from any apprehension about the weather. He does not regard the sky, nor the sea, nor the sails. On the contrary, he moves about, not with bold manlike step, as one having command of the vessel, but stealthily; now and then stopping and standing in crouched attitude, within the deeper shadow thrown upon her decks by masts, bulwarks, and boats. He seems less to occupy himself about the ropes, spars, and sails, than the behaviour of those who work them. Not while they are working them either, but more when they are straying idly along the gangways, or clustered in some corner, and conversing. In short, he appears to be playing spy on them. For this he has his reasons, and they are good ones. Before leaving San Francisco, he discovered the incapacity of the crew, so hastily got together. A bad lot, he could see at first sight—rough, ribald, and drunken. In all, there are eleven of them, the second-mate included; the last, as already stated, a Spaniard, by name Padilla. There are three others of this same race—Spaniards, or Spanish-Americans—Gil Gomez, Jose Hernandez, and Jacinto Velarde; two Englishmen, Jack Striker and Bill Davis; a Frenchman, by name La Crosse; a Dutchman; and a Dane; the remaining two being men whose nationality is difficult to determine, and scarce known to themselves—such as may be met on almost every ship that sails the sea.

The chief officer of the *Condor*, accustomed to a man-o'-war, with its rigid discipline, is already disgusted with what is going on aboard the merchantman. He has been so before leaving San Francisco, having also some anxiety about the navigation of the vessel. With a crew so incapable, he anticipated difficulty, if not danger. But now that he is out upon the open ocean, he is sure of the first, and fully apprehensive of the last. For, in less than a single day's sailing, he has discovered that the crew, besides counting short, is otherwise untrustworthy. Several of the men are not sailors at all, but 'long-shore' men; one or two of them 'land-lubbers,' who never laid hand upon a ship's rope before clutching those of the *Condor*. With such, what chance will there be for working the ship in a storm?

But there is a danger he dreads far more than the mismanagement of her ropes and sails—insubordination. Even thus early, it has shewn itself among the men, and may at any

moment break out into open mutiny. All the more likely from the character of Captain Lantanas, with which he has become well acquainted. The Chilean skipper is an easy-going man, given to reading books of natural history, and collecting curiosities, as evinced by his brace of Bornean apes, and other specimens picked up during his trading trip to the Indian Archipelago. A man in every way amiable, but just on this account the most unfitted to control a crew such as that he has shipped for the voyage to Valparaiso. Absorbed in his studies, he takes little notice of them, leaving them in the hands, and to the control of his *piloto*, Harry Blew. But Harry, though a typical British sailor, is not one of the happy-go-lucky kind. He has been intrusted with something more than the navigation of the Chilean ship—with the charge of two fair ladies in her cabin; and although these have not yet shewn themselves on deck, he knows they are safe, and well waited on by the black cook, who is also steward, and who, under his rough sable skin, has a kindly, gentle heart. It is when thinking of his cabin passengers that the *Condor's* first-officer feels apprehensive, and then not from the incapacity of her sailors, but their bold, indeed almost insolent behaviour. Their having shewn something of this at first might have been excusable, or, at all events, capable of explanation. They had not yet sobered down. Fresh from the streets of San Francisco, so lawless and licentious, it could not be expected. But most of them have been now some days aboard—no drink allowed them save the regular ration, with plenty of everything else. Kind treatment from captain and mate, and still they shew scowling and discontented, as if the slightest slur, an angry word, even a look, would make mutiny among them. What can it mean? What do the men want?

A score of times has Harry Blew thus interrogated himself, without receiving satisfactory answer. It is to obtain this he is now gliding silently about the *Condor's* decks, and here and there concealing himself in shadow, in the hope he may overhear some speech that will give him a clue to the conspiracy—if conspiracy it be. And in this hope he is not deceived or disappointed, but successful even beyond his most sanguine expectations; for he at length gets the clue not only to the insubordination of the crew, but all else that has been puzzling him. And a strange problem it is, its solution positively appalling. He gets it while standing under a piece of sail-cloth, spread from the rail to the top of the round-house—rigged up by the carpenter as a sun-screen, while doing some work during the heat of the day, and so left. The sky being now starless and pitch-black, with this additional obstruction to light, Harry Blew stands in obscurity impenetrable to the eye of man. One passing so close as almost to touch could not possibly see him.

Nor is he seen by two men, who, like himself, sauntering about, have come to a stop under the spread canvas. Unlike him, however, they are not silent, but engaged in conversation, in a low tone, still loud enough for him to hear them—every word said. And to every one he listens with interest so engrossing, that his breath is well nigh suspended.

He understands what is said; all the easier from their talk being carried on in English—his own tongue. For they who converse are Jack

Striker and Bill Davis. And long before their dialogue comes to an end, he has not only obtained intelligence of what has hitherto perplexed him, but gets a glimpse of something beyond—that which sets his hair on end, and causes the blood to curdle in his veins.

### THE ROUGH

THE rough comes into the world in a low-ceiled, stuffy bedroom, containing, besides the dirty bed, a broken chair or two, a scrap of looking-glass, a chest of drawers with one of its fore-feet missing, or a locker which serves as both seat and wardrobe. The washing apparatus is to be found at the sink down-stairs. He is wrapped up in a blanket, and dressed in the clothes which his mother somehow or another always appears able to provide, frequently from the Dorcas Society of the neighbourhood or parish. He is cradled either in a corner of his mother's bed, or in a deal box in which fish, fruit, or firewood has been hawked about. His father welcomes him with a jovial burst of the language of Billingsgate, but soon tires of him, and contents himself with recognising him as a fact, while he appears to ignore him as offspring or relative.

He receives the stamp of individuality by entry in the Registrar's book as a male child, born in such a place and at such a time, and destined to distinguish some name which his father usually selects, being careful that it is one which will bear shortening into a sharp though tender monosyllable. Possibly, by dint of perseverance on the part of clergyman or visitor, he is taken to church to be christened; although his father objects to being of the party, not only on the general ground of his disinclination to enter a place of worship, but also on the more particular one of dislike to be seen entering one 'with a lot of women and babbies.' We can recall a scene in which the father did accompany the mother, and gave the name—'Tom!' 'Thomas,' amended the clergyman. 'Tom! T, O, M!' was the abrupt reply. Whereupon the clergyman christened the child Thomas, and giving him back to the disconcerted parents, said gently: 'You can call him Tom, you know.'

Tom is next vaccinated, after some little difficulty with the authorities. Sometimes the result is unfortunate; large sores, generated by dirt and aggravated by neglect, making him a burden to himself and his friends. Soon he can crawl. He is then handed over to the preceding baby as to a guardian angel, or to Jemima Ann if there be an elder sister, and at once sets himself, as naturally as young crabs walk sideways, to practise self-will, to cultivate his appetite, and to spoil his complexion and often his features. He makes mud-pies, and builds houses with bits of broken china. He is now and then lost in the anxious pursuit of the paper-windmill seller, and taken to the station-house to be left till called for; where his mother finding him, divides her feelings into anger and joy, and their manifestation into slaps and cuddlings, shaking him till the growth of his teeth is stimulated by the repercussion, and then carrying him home in her arms with a carefulness that threatens suffocation. His tears and other facial

outcomes of grief are kissed away by the sympathetic tongue of the sturdy bull-terrier that inhabits the back-yard or the cupboard beneath the staircase.

Growing older, he receives more notice from his father, who holds him on his knee while at his meals, giving him bits and scraps, and occasionally permitting him to bury his nose in the mug of beer he fetches from the public-house. Then comes school. The present adult rough escaped that which has already become a standing nuisance to the rising generation—the action of the compulsory education principle, through the agency of the school-board officer. This new enemy is a source of greater terror to him than the policeman. The latter only says, 'Move on;' the former, 'Move in.' And in he has to move; and once in, he has to endure the two sufferings least congenial to his nature—restraint of body and application of mind. As regards out-door recreation, he can watch his seniors play at pitch and toss, or as an unobserved observer may learn the proper terms in use at rat-worries, pigeon-flying, or dog-fights. His home-training is, alike by example and treatment, brutalising and violent.

At length, with just enough literary residuum to enable him to write his name, and pick his way through a newspaper report, omitting the long words, Tom is promoted to work. Exceptions to the rule exist: some boys are naturally ready at learning, and leave school tolerably well-grounded in elementary subjects. These either raise themselves above their original condition and associates, or become their oracles. Now the animal nature predominates, with scarcely anything to check it. He is bullied by the man he works for, and is independent at home. As his wages increase he provides himself with luxuries and recreations. His first pigeon occupies all his affections and all his spare time. He carries it in the pocket of his coat out into the fields or some open space, where he throws it up, and then follows it home. Or he may turn his fancy to a puppy. In either case he will save himself before his pets grow lean from want of food.

But it is after the period of boyhood, and before that of mature manhood, say from seventeen to five-and-twenty, that the title of which we are treating is most fitly applied to those who bear it. Then the animal spirits are highest, and there is no experience to check and direct them. This, then, is the period during which society suffers most annoyance from Tom. He and his fellows supply most of the weight, and nearly all the noise and mischief, in every general disturbance or riot. They are the patriots who fling red or blue powder at elections, who smash the windows of the unpopular candidate, who hustle individuals wearing the wrong colours; and are the politicians who support the Licensed Victualler, declaim against the Permissive Bill, and teach their dogs to snarl at the words 'Good Templar!' And so grows up the juvenile rough as a nuisance to society.

Of all the disagreeables the policeman has to know, the chief, after those arising from drunken and quarrelsome women, are inflicted upon him by the youthful rough. He has nothing technical to charge him with; the pavement is free to all; in this land all may laugh as they please, and may even bite their thumbs without breach of the law. No doubt it is very aggravating to a sedate

constable, whose movements are regulated by drill, and who is debarred from the natural relief of repartee and retort, to observe that his personal presence in a street is the cause of all kinds of mocking movements and sarcastic colloquialisms. The human nature in the constable is, of course, stirred up by all this; but it has to be endured. He knows well that by the second time his face is seen on that most objectionable beat he shall have a nickname, which also must be tolerated. The truth is, the wit of the rough is usually exhibited in nomenclature. A lad from the workhouse was named, in a certain society which we were privileged to enter, 'Union Jack;' a red-headed lad was 'Ginger;' one with large eyes was 'Lights.' It would not be advisable to pursue the subject further.

When we come to watch the moral side of the rough, we discover a very saddening state of things. Whatever may be the cause or causes, the fact is patent that there is in it no nobility of character, and very little admiration for it; no moral courage and very little physical; and that honesty, truth, mercy, generosity—the qualities which soften down brute strength as ivy or honeysuckle softens down stiff outlines in buildings—are utterly wanting. We read lately, to a class of lads varying in age from fifteen years to twenty-two, the tale of *Damon and Pythias*, and then invited opinions. The first one was this: 'Well, I wouldn't have come back, not for my own father; live as long as you can, and as jolly as you can, I say.'

The absence of all training towards self-restraint in any direction in infancy and childhood is followed naturally by self-indulgence in all directions in youth and manhood. The young rough knows no self-restraint now. Beer and tobacco he has at all cost to him and his. Subordination he scorns. Regular work he hates. Bodily indulgences he procures, by proper means if he can; if not, he falls back often enough upon his brute force. From want of self-restraint, quite as much as from the various other reasons assigned by other people for him, he deserts from the army. The universal complaint against the army discipline made by his class—that there are 'too many masters'—proves the correctness of this view. There is no chivalry, no love of distinction, or hope of achieving honour, to be met with among the roughs. They only enlist to get a meal in bad times, to escape from some scrape in their own neighbourhood, or to get rid of a scolding and slovenly wife, married in the haste of boyhood, but repented of in the leisure which comes all too soon.

It was owing to this cause working out in the direction of restlessness, that several boys on one of Her Majesty's training ships, lopped off a joint from a finger of their right hands, in the hope that being thus disabled they would be discharged. We knew one at least of the culprits, and were rejoiced to find that this mortification of the flesh was so far from succeeding, that the ascetics who practised it were sent for a long service on the East India and China stations.

This want of self-restraint is seen in every situation and under every variety of pressure. The violent assaults, accompanied by lava-streams of blasphemy and abuse, that are the issues of the anger of the rough, testify to it in the province of

the emotions. The reckless gratification of the passion for drink, the plunging into marriage in boyhood without provision of money or furniture, shew that there is an utter want of it in the domain of prudence. In danger, none are so prone to panic, attended by the abandonment or thrusting aside of the weak, women, and children, as a gang of roughs—as the list of survivors from the *Northfleet* shewed. And as there is no self-command in times of physical danger, so there is no self-respect in presence of a promise. On more occasions than we care to recall, we have received a promise, with shaking of hands upon it, from young men of this class, who have not only deliberately broken it, but have shewn no signs of awkwardness on meeting us afterwards.

Envy of the rich, arising from a complete ignorance of political economy, is another unhealthy characteristic of the rough. He believes—for the public-house oracle reads it out of a paper—that all the increasing wealth of the country is gathered out of his work. His own wages he squanders as soon as they are received. Thrift, and the science of spending so as to obtain the largest return, are beyond him, as much as the faculty of laying by against a rainy day; nor can he comprehend their practice, or their natural and legitimate consequences, in others. Penny-banks in vain woo him while beer and skittles offer their charms. A Hercules in one respect, he makes a very different choice between the competing goddesses. All that he knows of such matters is, that somehow he gets no better off, while other people improve their dwellings, their clothes, their social position; that he labours for these others, and apparently is excluded from all share in their increase of prosperity. So he concludes that he is a down-trodden slave; and enjoys the sensation of envy, since he cannot enjoy that of wealth.

This class antagonism is the only principle or sentiment of cohesion pervading the rough community. Touchy, captious, and unreasonable, they can never combine for any permanent action. No clubs, bands, or other associations of them are long-lived. 'Every man for himself' is a scattering, not a rallying cry, and it is the cry of every individual among them. Still, should we ever undergo a national catastrophe—should there ever happen to be a suspension of the power of the law, there would be the risk of a terrible, however temporary, outbreak of the volcanic forces. The middle and upper classes, who would necessarily be on the side of order, would ultimately prevail, but the country would bear the marks of mischief and destruction for many a year; just as a valley, inundated by the bursting of a dam, exhibits, long after the waters have swept by, the effects of their ruinous though rapidly-ceasing visitation. No future civil war or rebellion in Great Britain would be so free from wanton destruction and plunder as those which took place in former centuries. The Bristol Riots have already taught us this.

Our remarks may have appeared somewhat severe. They are, however, the expression of opinions, based on an unbroken experience of nearly twenty years. And we venture, on the ground of the same experience, to touch upon a few points in which we believe there is hope of improving the class under consideration. For that they may be improved is certain; and to endeavour

to improve them is equally the duty and the interest of all Englishmen. Our belief is that the roughs—the labouring roughs—are not a criminal class; and we now add that they are an unfortunate and a neglected class.

Very much is to be hoped for from compulsory education and habitual discipline, the supervision of more refined persons, and the secondary intercourse, through the school, with the clergy and other persons of the cultivated classes. And it is on this account, as much, or nearly as much, as on account of the direct religious instruction imparted by them, that we should regret to see any steps taken which would exclude the clergy from their present free intercourse with the school. They form almost the sole remaining link between rich and poor in our large town districts. And it is to the modern separation in residence of these two classes, to their ignorance of each other's ways and mutual opinions, that much of the envy and bitterness to which allusion has been made is to be attributed. Tom grows to like the parson—he praises his writing, criticises his reading, gives him a new fact in his geography—and when Tom goes to make bricks or help to wheel the costermonger's barrow, he will feel that broadcloth and gloves are not necessarily the uniform of one that grinds down the poor. There will be at any rate one good influence upon him to counteract many evil ones.

But the residuum of school-learning, we may hope, will also be a great gain. We have for the last few months made a practice of observing the topics upon which working-men, especially the labourers, converse as they walk the streets or stand at corners; and we have discovered only three—work, money, and drink. The last is the topic of so low a stamp of man, that we dismiss it at once. The other two are subjects which occupy the thoughts of men of every class of society, from the millionaire peer down to the beggar at our doors; but what can be more dreary than to have these as the sole and perpetually recurring subjects? Can anything be more cramping, more stagnating, or less calculated to give elasticity to the spirits or breadth to the mind, than the continual brooding over these two material topics? Now we are sanguine enough to hope that an improved education, one which is to be not only more nearly continuous, but also more liberal and varied—for the new code deserves this commendation—will supply lighter and higher matter of conversation and reflection. Thus the rough, as he comes forth from school to work, will start better, will be less rough to begin with, than his predecessors. He will have more to fall back upon, and will be more readily receptive of better impressions. It must, however, be expected that for a generation or so the improvement will be very gradual: the present home will exercise its influence still; and we must be content to wait till the seed now being sown has its harvest, and that again its sowing and its harvest beyond.

In connection with mental education should be mentioned physical recreation. It is with respect to this that we remarked just now that the rough is unfortunate and neglected. At the time of life when the animal spirits are highest, and play of some sort a necessity for their healthy indulgence, what resources have Tom and his fellows? In no other country in Europe is there so great a

want, and so meagre a supply, of places for suitable public recreation. Corporate bodies, especially the corporations of provincial towns, are notoriously short-sighted, but in no other respect does their shortness of sight lead them into such a labyrinth of petty troubles as those arising from the withholding of places of public recreation. Men of wealth, and educated to a certain degree, with sons of their own at public schools, whose talk is mainly upon athletics and cricket, do not seem to understand that young men are alike in physical requirements, whether students or costermongers, and that recreation, sports, games, exercise, are as necessary to keep the young rough out of mischief as to entertain the young gentleman in his spare hours. If we had more harmless and wholesome sports for the roughs, we should want less of the jail. At first, of course, there would be some abuse of the opportunity, but an improvement would certainly follow and remain.

Even clear spaces with seats, a few trees, and a drinking-fountain, without offering opportunities of exercise, would have a great moral effect. The general good-humour of the poor would be increased by having a spot to which they could go for a refuge, however short, from the steam of the washing-tub or the cry of babies. Leicester Square is far more luxurious than our ideal, but affords us an instance of our meaning. There is many a waste spot in the poorer parts of our large cities where a few seats might be placed, and a general air of comfort might be introduced. They would serve as the Rotten Rows or Birdcage Walks for the big lads and youths, and so drain off the gangs from street corners and alley mouths.

Indoor comfort, too, is but poorly provided. Whose son would not lose self-respect, decency, and courage, if bred up in foul air, close quarters, and dark rooms? The home makes the rough as much as the street. The cracked wall letting in the rain in patches of damp, if not in drops of water; the smoky chimney; the confined kitchen, staircase, and sleeping-rooms; all these have their noxious influences, and those influences are of a hardening, souring, and brutalising tendency. With more room, and with better provision for decency, we may expect to find a growing appreciation of the idea of home. Few circumstances are so aggravating to the temper as want of room for freedom of movement.

There remains, however, another means of softening the rough—the intercourse with his betters in a kindly, friendly spirit. But this is an undertaking that few volunteers to join in. Nor is this surprising. Tom has nothing attractive about him. His look is against him, so are his manners, so is his language. No gentleman tries to make friends with him, unless it be in a patronising way that he suspects. So the breach between him and the wealthier and more powerful classes of society threatens to widen, and Tom's isolation to become more complete. We are experimentally sure that the only way to raise the individual is by friendly intercourse with him. Like all untutored races the roughs can feel very warm affection, and by means of the affections they can be raised. A clergyman or volunteer layman of distinct position—that is to say, of sufficiently liberal education and politeness of manner to rank as a gentleman conventionally, can achieve far more in the way of their

improvement than policeman, magistrate, and turnkey; for he will bring to bear upon them the refinement and gentleness of his own rank, and will patiently bear with their coarseness and fickleness. The 'British Workman' movement, by which coffee-rooms, with newspapers and indoor amusements, such as draughts or billiards, are opened in promising localities, affords good opportunities for cultivating this friendly intercourse; as also does the management of penny banks, temperance associations, drum-and-fife bands, and teaching in evening or Sunday classes. A feeling of respect and affection for one individual alone is capable of extension, and of introducing other elevating sentiments; self-respect and self-restraint among the first; toleration of reproach, and submission to the judgment of others, later on. And thus the soil is prepared for the reception of the gentle influences of Christianity.

There are two matters in which the action of the state is greatly needed for the improvement of the overstocked population of the class we have been reviewing: the one is emigration, the other the drink traffic.

Of the former of these subjects, the rough is equally ignorant of the facilities and prejudiced against the advantages. His *morale* in the department of industry is so undermined by the pernicious system of outdoor relief, that he shrinks from embarking on a voyage that will end in a land where he must work or starve. One sunny day we sat on a door-step in a miserable street, and conversed with Ginger, Lights, and a dozen more of our friends, all in the flower of their youth and vigour, but out of work through a strike and collateral causes. We held out the advantages of emigration to such as they, and promised to assist in every way such of them as would make trial of it. 'Look here, sir,' said one; 'see my hat' (it had been a good one once, but was shapeless and full of holes now); 'if I was to know I should have this hat'—and he banged it down on the stones—'full of gold sovereigns when I got to New Zealand, I'd stay at home and live on half a meal a day.' And the only reason we could elicit was, 'There's no back-door to come home by!' Education will enlighten on this head, as on others; and when a better understanding of the advantages shall by that means have been obtained, then it will be good policy on the part of the state to offer even greater than the present facilities for reaching them. Both the old and the new countries will be benefited by such a policy.

Meanwhile the drink traffic needs restrictions of a far more efficient character than exists at present. In a street where every man, if he chooses, can get a license to sell beer, sobriety is a plant of rare growth; and the want of recreation, to which we have before drawn attention, sends more customers than thirst or habitual drunkenness. The shortened hours of labour and the increase of wages, which we have witnessed during the past five years, have resulted, in our experience, in no real material good to any persons but the publicans. Limit this trade, not only as regards the times, but still more as regards the places of its action, and the source of most of the brutal assaults, quarrels, and brawls will be proportionately diminished. The police records of Liverpool can testify to the correctness of this opinion, from the obverse side of the case. The rough will possibly never cease

out of the land: but a reasonably restrictive law can remove much of the evil which helps to make him what he is.

## SALVAGE.

### IN TWO CHAPTERS.—CHAPTER II.

'DENIS DELMAR, you might have spared me this; my burden was already more than I knew how to bear.' She could say no more for the sobs which choked her utterance. In an instant, he was tenderly soothing her; and then this artful dog began to explain that it was not compulsory they should part.

'Alice, my darling,' he said, 'circumstances have occurred to-day which render it probable that my father may be induced to consent to our union. I am even now going to write to him, and I have every hope of my happiness depending only upon you, my dearest one, for its speedy fulfilment.'

The colour came and went, came and went, came again, and remained in her cheek. These few moments had done her more good than a six months' course of doctors, who would one and all have persisted in attacking the mind through the medium of the body, instead of the body through the medium of the mind. Already Alice looked changed for the better, and resting on the fond vision of future joy held out by that wicked Denis, she thought only of her present happiness. Denis soon found that she knew nothing of the late events; they had evidently been carefully concealed from her; so he forbore to enlighten her. Before he left that evening, he and Mr Graham had decided to keep the news of the former's peril from her, in consideration of her health. Long time they sat there, these reunited lovers, hand in hand, beauty and courage combining—what had they to fear from the world!—blissfully happy in each other's presence. Gently Denis drew her towards him, and gazed down into the depths and the summer of her brown eyes, in search of future happiness; and there he saw reflected the image of himself, which was itself an image of perfect bliss. Presently, Mr Graham came in; he asked no questions then; the scene explained itself; and so passed away the quiet gloaming, and again the night came down; the soft evening breeze blew gently in at the open window, and Denis felt the supreme power of *love*, and thought of his late wrestle with the power of *death*; and contrasting his present situation with that of the previous night, silently thanked his God for this great mercy, and was at peace.

When Denis left his hotel to follow Alice in the carriage, a man had watched his proceedings from a window with great interest, and with a face that wore a look of tenderness, tinged with a shade of sadness.

The Honourable Denis Delmar to Lord Delmar:

I trust you will believe me when I say that it is only through an *accident* that I have again seen Miss Wentwood; chance has thrown her once more in my way. Always delicate, my supposed desertion has seriously affected her, and already she is very ill. My father, if you separate us, you will have to answer for at least one death. But I feel that I cannot leave her. Once more, sir, I implore you to consent to our union, otherwise, I will

not answer for the consequences. Remember that I have always been a dutiful and obedient son, until now; weigh well your decision, I beseech you, and believe in the affection of your son,

DENIS DELMAR.

Lord Delmar to the Honourable Denis Delmar:

I need not tell you my pain and surprise on reading your letter. You well know my feelings in this matter; you have been unworthy of my confidence; but let that rest. Break off this unhappy connection, once and for ever, and retain my love; but if you can prefer the companionship of a girl sprung from no one knows where—to wealth, the society of people in your own station, and the regard of your parent—you are not worthy to be my son, and henceforward you will have to look to yourself alone for support. *I await your reply.*

The Honourable Denis Delmar to Lord Delmar:

Society is nothing to me without that of Alice Wentwood, and wealth would be a poor recompense for causing the death of one who looks to me for life and love. Pity and forgive me, sir; I cannot give her up.

Lord Delmar to the Honourable Denis Delmar:

If you persist, recollect that you choose your own path; follow it, and when you require counsel and assistance, perchance bread, remember that you have no longer a father.

P.S.—Your allowance, which will be paid in future through my bankers, will cease the moment you marry against my will.

The day following the receipt of this cruel and malicious letter, Mr Gimp and Denis were seated together at the hotel; the gloom on the face of the young man had greatly increased, and his whole aspect was careworn and haggard, speaking of utter dejection. He held his father's letter in his hand, but his eyes were bent upon the ground; he was cut to the heart. In the shock of the collision between these two obstinate natures, the outer covering of his father's love had fallen away, and left only the man's pride and selfishness exposed to view. And the lightning of his anger had, so to speak, scorched up the veneration and respect of the son for his parent. We know how bitter is the shock of the fall of a long-cherished idol. Mr Gimp, who had read the correspondence, had made no effort to console him; as yet, it was useless, and he seemed to be awaiting a fixed time to speak; it came at length.

'Denis, my poor fellow, be comforted.'

With a start, the other interrupted him; he had forgotten his presence; he was irritated, almost mad.

'Sir, I do not think my sorrow, which is caused by family affairs, can be relieved by useless talk, and I should be glad to be alone, if you will excuse me.'

The old man rose, and regarded him with a look of compassion, while the heart of Denis smote him hardly for his ingratitude.

'A few words before I leave you,' said his friend. 'Now answer me this: will you still hold to Miss Alice Wentwood?'

The answer came clear, and the tone was wrathful and deep: 'By Heaven's help, I shall!'

'And yet your happiness rests upon your reconciliation with your father?'

'It does' (huskily).

'Then listen to me, Denis Delmar: you shall have that wish, and I will adopt you as my son until that prediction is fulfilled. I command you to accept my offer, Denis Delmar; I command you, by the life and fortune you have restored to me. Denis, my boy, a childless old man asks for a son; will you not give him one for his old age?'

Denis could hold himself no longer. His heart went out to the old man—whose looks and manner had some mysterious power—and he embraced him with protestations of thankful regard only equalled by the abuse he poured down upon his own head for his recent ingratitude.

'Say no more,' said Mr Gimp; 'but obey my first request. Marry this girl as soon as you possibly can; announce your marriage to Lord Delmar; and join me in London, whither I go to-night on urgent business. I will obtain rooms for you. No thanks, dear boy; I need them not; simply do for me the greatest favour in your power, by acting as I tell you. Now, go and worry Alice until she fixes a day; and the sooner you are "turned off," the better for all parties. Bear my compliments, meanwhile, to the bride-elect; and say I regret having to defer making her acquaintance until we meet in town. Commend me to her good friend the lawyer. And now, good-bye, my dear boy: remain here till I send for you, and take great care of yourself; henceforth, you are necessary to me.' So saying, he shook hands warmly with the young man, and left the room to prepare for his journey.

The day following this scene, Lord Delmar received a letter couched in the following terms:

MY LORD—You have seen fit to injure your son by an unjust and cruel act. That injury will be revenged. You have cast a slur upon the name of Delmar by the infamous suggestion contained in your letter. That stain will be wiped out. You have cast from you the love and adherence of your son; another has taken it up. Extend your forgiveness at once to him who bears your name, or be prepared for the punishment which will surely follow your cruelty and injustice. A FRIEND.

'So,' exclaimed his lordship as he finished this epistle—'so Denis has descended to this, has he? Well, I am not surprised; but just a little uneasy in his mind, he finished his breakfast.'

Mr Graham had placed Alice with some friends, as he himself had returned to town—the day after we last saw him—on the plea of important business. Denis called on her after Mr Gimp's departure. 'Pussy, what do you think? I have received my orders to marry you at once!'

'Indeed!' was the arch reply. 'And where shall I be, while you are doing it?'

'I trust, by my side, my pet; swearing to love, honour, and o'—'

She stopped his utterance with a pouting kiss. 'Yes; but I haven't sworn yet; so I am not going to obey, you know, at present. And, besides, I have my marching orders. Listen, Denis;' and she read, slowly and methodically:

"23 QUEEN'S SQUARE, BLOOMSBURY,  
August 29, 18—."

'MY DEAR GIRL—Come to me at once at Queen Square. I have some papers which you

must sign directly; and as your presence is indispensable, come by."—

'The —,'

'No, Denis; "the next train"' (very demurely). Reading resumed. "'I am very busy, and scarcely find time for this; so please excuse me from—Yours, affectionately, JAMES GRAHAM."'

'So now, Denis, I must go and pack.'

'Eh?'

'I say I must go and pack.'

'Ah!'

'Good-bye, Denis' (preparing to go).

'Here! stop; you know I'm going with you. You can't go alone.'

'I don't intend to; old Mr Maxwell is taking me under his wing.'

'I'm going too.'

'No; you're not.'

'Well, but —'

'Your promise to Mr Gimp.'

'Oh, the —!'

'Denis, that's twice' (gravely); 'I am very angry.'

He apologised. She forgave him. He tried to reason with her. She was obdurate. He expostulated; but in vain; the wilful girl would have her own way; and so, after many a tender passage-at-arms, the lover was left at Dover, while Alice took the iron road for London.

Poor Denis, left alone in his glory (?), cruised round in the *Firefly*, after the usual erratic manner of that insect. A week passed, and no letter from either of the absentees; ten days; Denis got troubled: he had written fourteen letters, and telegraphed twice to Alice, and never had a line. Presently, a bitter despair took possession of his heart. 'She has deserted me,' he cried, 'now that I am doubtless disinherited.' (He had refused all assistance from Lord Delmar.) No sign came from his strange well-wisher, who left no address. He was now at the end of his resources. A fortnight elapsed: he sold the yacht, which was his own; paid his bills, and resolved to go to town, seek out Alice, and find the reason of her extraordinary silence. His feelings of delicacy prevented his tracing Gimp. Having settled everything, he resolved to depart one hot and sultry day; the clouds were heavy and massive, so different to the light fleecy look they had lately borne. He thought it significant of his changing fortunes, and sighed. All nature was hushed, seeming to hold its breath in anticipation of a coming storm. Shortly after breakfast, it broke; the rain came down in torrents, and Denis was compelled to remain in-doors. He took up a newspaper to beguile the time. Suddenly, a vivid flash of lightning passed across the paper, and he saw fearfully distinct the words, 'Found drowned;' and as a fearful peal of thunder reverberated through the heavens, he read the following paragraph:

'Yesterday morning, some watermen discovered the body of a man near the Waterloo Bridge; when found, he was quite dead. Deceased has the appearance of a gentleman, and it is believed by some persons who saw him the previous day in an hotel, that he had lately arrived from abroad.' Then followed a description of his appearance and dress, which coincided in a great measure with those of Gimp. Denis dropped the paper; he turned faint, and a mist swam before his eyes.

He was aroused by a waiter entering with a letter. Denis took it, and opened it mechanically. The writing was unknown to him:

3 GRAY'S INN SQUARE, LONDON, W.C.

SIR—It is with great regret that we have heard of your late estrangement with your father, Lord Delmar, which fact we obtained from Mr Graham; as also of your refusal of assistance from him. We therefore take the liberty of informing you, that a friend and client of ours is in want of a private secretary and confidential friend. Should you entertain the idea, and will favour us with a call to-morrow afternoon at three o'clock precisely, our Mr James will introduce you; and you will pardon our reminder, that your acceptance of the post for a short period will give you time to look about you, and mature your plans. You are, however, of course aware that, as you still want a month of your majority, Lord Delmar is legally responsible for you until that period.—We remain, dear sir, yours obediently, JAMES AND HURST.

*The Hon. Denis Delmar.*

Denis remembered the name of the firm as one who had transacted business for Lord Delmar some time back, but he was at a loss to account for the extraordinary interest they appeared to take in his affairs.

'Have I indeed fallen so low, that I am patronised by attorneys, and become an object of solicitude to lawyers' clerks?' he exclaimed bitterly. 'No matter; I will go; I can stand this no longer; I shall at least endeavour to seek Alice. I will take up the gage which misfortune has thrown down, and accept my destiny. Of one thing I am determined—I will never accept of one farthing from him.' That night, Denis was in London.

About the same time as he arrived, Lord Delmar read the following epistle:

3 GRAY'S INN SQUARE.

MY LORD—If you will call at my new office to-morrow at three o'clock, I believe I shall be able to give you some good news which materially concerns you, of a relative you have long believed dead. Hoping to see your lordship at the hour named, I am your lordship's obedient, humble servant, JAMES GRAHAM.

The perspiration stood on the forehead of the haughty noble in great beads, yet his head and hands were cold as ice, and the letter dropped unheeded from his nerveless grasp.

The same day that Denis was to meet these lawyers, Mr Graham informed Alice that he intended to take her to transact some business with a friend, and that her presence was indispensable. Much marvelling, the fair young girl set out with the old man. They took their way to Gray's Inn Square, and were admitted by a youthful Adonis, who gazed admiringly at Alice, and, with a killing air, informed them that he would acquaint his employer of their arrival; and, being thanked with a smile, retired, covered with ink and confusion. Mr Graham left Alice seated in a dingy room, such as can only be found in the possession of a lawyer, and went in search of the friend. Our heroine had not remained long alone, when an old gentleman was ushered in, of noble appearance, and whose face bore a resemblance to some one she knew. Endeavouring in vain to recollect, Alice took up a newspaper of ancient date; but

scarcely had her eyes rested on the page, than, with a little cry, she sank back into the chair, overcome by emotion. Lord Delmar—for it was indeed that austere individual—was at her side, and cast upon her an admiring glance. Acting on an impulse, she pointed to the paragraph which had caused her exclamation. It was headed, 'True but Rare Nobility,' and contained a full account of the fearful gale at Dover, and the peril of the *Leopard*, as well as the history of the saving of the ship and crew by the 'Honourable Denis Delmar, the son of Lord Delmar, who, at the imminent risk of his life, put out to sea in a small boat, at fearful hazard, and after a whole night's pulling, succeeded, with the assistance of his volunteer crew, in boarding the ship, and saving her entire, by bringing her into port.' The brow of the old nobleman involuntarily lightened, and his eyes beamed as he read this account of the bravery of his cast-off son. In the excitement of the moment, his anger was forgotten.

'How grand!' exclaimed he. Alice revived.

'Grand indeed,' repeated she. 'His mind is as noble as his acts are brave.'

'Phuegh!' whistled the old boy; 'this is true celebrity.' Alice buried her burning face in her hands.

'He never told me, he never told me!' she murmured.

'Hollo!' said the old one; then, noticing the distress and confusion of Alice, and taking regard of her beauty, he advanced, and endeavoured to console her. 'What may be your name, young lady, if you will excuse my curiosity?' Alice hung her head, and the tears forced themselves to her eyes in spite of all her efforts to appear composed. Then this strange man, who could without compunction discard his only relative for following the dictates of his own heart and conscience, felt uncomfortable at the sight of water oozing from a girl's eyes—we beg pardon, Beauty in tears. Going up to her, he took her hand, and, yielding to the power of her fascination, heartily wished himself young again. 'Will you not tell me your name, my sweet child?' At this moment, and before Alice could reply, the door opened, and another clerk appeared: 'Mr Graham will see Lord Delmar.' His lordship, turning to take leave of Alice, was startled at the look of horror and surprise upon her face; he had no time to ascertain the cause, as the clerk still awaited him at the door, and, turning his head once more, he saw her in the same attitude, and then left the room, much mystified. He was speedily ushered into the sanctum of Mr Graham, who rose as he entered, and requested him to take a seat. Then, as his lordship waited for him to commence the conversation, he said: 'Before entering upon the business about which I wrote to you, my lord, I will take the liberty of asking you a question. In case of a—ahem!—your son forming an attachment to a young lady of gentle but inferior birth to his own, would you consent to their union, provided she was educated, lady-like, and his happiness centred in her?'

'Sir,' replied Lord Delmar, coldly and haughtily, 'I have no son; and if I had, he should wed no one who was not his equal in rank and position at least.'

'Then, in that case, you would give your consent?'

'Sir, your cross-examination seems to me slightly impertinent; but as I have no reason to reserve my reply, I will answer you, to put an end to the useless discussion, that I would consent to his marriage with his equal, provided she was not absolutely portionless.'

'This is your decision, my lord?'

'Certainly it is.'

Mr Graham rang his bell, and the clerk instantly appeared. 'Shew in the young gentleman who waits.' A moment, and Denis appeared. 'Now the lady.' Then entered Alice, wondering what it all meant. After her, came the figure of a man, closely muffled, who shut the door, and took a seat near it, in the shadow. Denis looked at Alice in amazement; she gave a little cry of delight, and, utterly regardless of Lord Delmar or Mr Graham, who looked quite calmly on, they embraced tenderly.

'My lord,' said Denis, 'I come to claim your promise, though sooner than I expected.—Look up, dearest Alice; this is my father. You need not fear him, for Mr Graham assures me that you are my equal in rank and position. Is it not so, sir?'

'It is,' said Mr Graham quietly.

Alice raised her eyes imploringly to Lord Delmar, and disclosed to his astonished gaze the face of the lady he had previously endeavoured to console, though unsuccessfully. It was some time before he could gain sufficient control over himself to speak; when he could, the words came cold and bitter from between his sneering lips.

'So this is a conspiracy to obtain my consent to a marriage between a beggar and a penniless plebeian.'

'My lord, you have renounced and disinherited your son; therefore, he is a penniless orphan, and the lady is his equal. Thus, also, by your own words, you consent to his union with one in precisely his own position.'

'Pshaw! this is mere quibbling, and worthy of a lawyer.' Then, turning to Denis: 'As for you, wretched boy, my curse!—'

Denis advanced, and caught his uplifted arm. 'You were my mother's husband, sir. Oh, do not curse me! I do not ask of you your wealth, or even the succession to the title; only let me have your consent to our marriage, and we will go abroad, and, in quitting you for ever, endeavour, in a foreign country, to obtain the subsistence denied us here.'

'You have heard me,' said the stern old man; and he drew himself to his full height. 'Now, leave me; never let me set eyes upon you again, or that artful and designing creature by your side. *You will never have the consent of Lord Delmar.*'

Denis had calmly submitted with bowed head to the bitter invective of his father, but on hearing the words recorded above applied to his darling, his passion was fearful, and gained the complete mastery; he glared upon his lordship, with flashing eyes, and brow black as night. What his action on the dire impulse might have been, no one knows. Happily, however, he was arrested by a deep voice saying: 'Hold! Denis Delmar; I command you. Poor boy, you have been too sorely tried.' All, except Mr Graham, gazed with speechless astonishment at the door. The voice had come from the unknown, who had risen, and advanced a step. The voice continued: 'You are forsworn, Denis Moreton; I say she *shall* marry with Lord Delmar's consent.'

With a fearful start, his lordship turned towards the speaker. 'Who calls me by that name?' said he hoarsely.

'One who knew your brother, Herbert Moreton.'

All started at the change in Lord Delmar's face; he seemed to have aged ten years; his cheeks were blanched, and his eyes seemed as if they saw visions of a fearful nature. He sank into a chair, breathing heavily; he was speechless. The stranger advanced from the shadow towards the young couple, as, with a glad and joyful cry, Denis recognised his friend and adopted father. The old man, for it was indeed he, turned a look of longing affection towards the youth; then appearing to constrain himself by a mighty effort, he turned to Mr Graham, who sat looking as if he knew all about it, as perhaps he did: 'James Graham, I have come to ask of you my ward. Where is my pet, my little Alice, the daughter of my dearest friend?'

Mr Graham pointed smilingly to Alice, who was in an instant clasped in the arms of her new-found guardian. Lord Delmar moaned.

The surprise of Denis at this scene was almost amusing; he stared from one to the other with a bewildered and almost petrified look. Who was this old man to whom everybody seemed to belong? Gimp advanced and took his hand, and pressing it warmly, placed it in that of Alice, saying: 'Cherish her, my boy; she will make you a loving wife, for I see she inherits the disposition of her father.'

A passionate exclamation broke from the lips of Lord Delmar. 'Who are you, sir?' cried he, livid with passion, though he half feared the reply. 'By what right do you dispose of a son in the presence of his father, and how dare you sanction his union with that beggar?'

'By the right of the life he gave me, Denis Moreton, when he rescued me from the cruel sea, and saved me from a watery grave. You have renounced the affection and adherence of this noble boy; I have adopted him. You yourself have said he is no longer your son. I will make him mine. I sanction the union, because you have given your consent to his marriage with his equal in rank and position. At present, my ward is both; and I will tell you why, Denis Moreton. You are not his father.' As he spoke, his form seemed to expand, his eyes flamed, and as he advanced, he looked an avenging spirit about to consummate his triumph. He threw off his overcoat, white wig, and comforter, which had quite concealed his person and the lower part of his features, advanced slowly to Lord Delmar, and laid his hand on his shoulder. His lordship took one look at his features; the word 'Brother!' with a shriek of agony, burst from his lips; he sank back, glaring with speechless horror, as at a spectre of the dead. Then was heard the deep voice of the other, who looked ten years younger, in proportion as Lord Delmar had aged.

'Denis Moreton, I have come back to claim at your hands my title, and more especially my son. Where is he? Have you nourished and supported him? Have you been to him as a father, as you swore to be, before God, when I suffered for your crime? Give me my boy, my darling boy, whom I have longed for, and dreamed of, all these years of suffering caused by you! Denis Moreton, I demand of you that which you hold in trust for me—my estates, my title, and, more than all, my

son.' Sternly he gazed on the countenance of his false brother; but the horror, the agony of remorse, the piteous cry: 'O God, O God, have mercy! Henry—brother, pardon!'—as he sank unconscious in his arms, went to his heart; and bearing him up tenderly, he reproached himself for arrogating the divine right of vengeance, as he placed the insensible form of his brother on the couch. Then he turned his eyes on Denis, and cried: 'Denis; my boy, my dear son, come at last to the heart of your father in reality.' As he fondly gazed on the noble and candid features of his restored son, and as he recalled the truthful and loving expression of the dear companion and wife, long since numbered with the just, his eyes filled with tears, and he pressed the youth still closer to his breast. Then calling to Alice, he joined their hands, and with the solemn words, 'THUS LORD DELMAR GIVES HIS CONSENT,' blessed them with all the fervour of a fond parent and affectionate guardian.

'Dear boy,' said he, after a pause of silent thankfulness, 'I owe you some explanation of this scene, as I see you do not yet guess all. Be seated, and I shall relate an old man's story. You were three years old when I accompanied your uncle (my younger brother) on an expedition, the particulars of which he refused me, but said that it was indispensable that he should return the same night, and that he required my assistance. I heedlessly yielded to his solicitations, and we went down to the sea-coast. He left me standing some distance from the water, with instructions to fire a pistol if I saw any one approaching from the interior. Before I could demand an explanation, he was gone. I remained some time in my position—it seemed to me hours—when suddenly I saw the form of a man advancing quickly from the cliffs. I fired my pistol at once, and at the same moment heard other shots, and my brother's voice raised above the din. I instantly ran forward in the direction of the apparent conflict, when I was stunned with a blow on the temple, and when I recovered, was in the hands of the coast-guard, together with some four or five smugglers, all bound, like myself. My brother was nowhere to be seen. In vain I protested my innocence; I was only laughed at; but when I reiterated my plea of ignorance of the affair, oaths took the place of derisive smiles, and I was ordered to be silent. During my incarceration in A—prison, my brother visited me, and implored me not to divulge his secret, as he was deeply involved with the gang, and he feared the worst, if it was known that he was the leader of it. I consented, upon condition that he would take upon himself the care of little Denis, your mother having died while giving you birth. He swore a solemn oath to do this. How he fulfilled his oath, I leave to the judgment of his Maker. I have already exceeded my mission. To make a long story short, I escaped, and obtained a commission in India, after which, having embarked in several prosperous speculations, I sold out of the army, and rapidly amassed a large fortune. I had previously heard of the accession of Denis to the title, on the death of my father. Hearing at last from Alice—with whose father I had served, as you know, and promised to undertake the care of his child—of the conduct of my brother, and the attachment between my son and my ward, I resolved to come

over and set matters right. I started for England, and what happened afterwards, you know.' With a trembling voice, he added: 'I owe my life to my own son.' He was silent for a moment, then he resumed: 'When I left you, Denis, at Dover, I came to town, and communicated my intentions of testing your honour, your patience, and your filial obedience, to Mr Graham. How greatly I am satisfied with that trial, your conscience and my looks will tell you, dear boy. We also planned this surprise, and God in His mercy grant that it may not have been carried too far.' As he spoke, he knelt by the side of his recreant brother.

'Come, Denis; this is all forgotten now; I am happier and more prosperous than I should have been, had I remained in England. Come, brother; when we have provided for these foolish young people, we will go down into Dorset, and spend the remaining years of our life in the country-house of our fathers, and try and forget the past. Look up, Denis—look up; all is forgotten and forgiven.'

Ere dropping the curtain, we see Denis standing in the centre of the stage, his affianced wife on the one hand, his new-found father on the other, and happiness and love hover above and around them. These are what our noble hero saved with the ship. This was Denis Delmar's *salvage*.

#### THE MONTH: SCIENCE AND ARTS.

EDUCATION may now be regarded as a perennial question, and when we find the universities holding public meetings for the purpose of promoting what is called 'university extension' in our large towns, we may conclude that a solution in some sort will be arrived at. Systematic training of the mind is essential to education; but there are thousands of persons interested in the subject who look upon instruction and education—pouring in and drawing out—as one and the same thing. A man may be crammed with knowledge and yet remain uneducated; and he may have a well-stored memory, but be utterly devoid of conscientiousness. If these trite propositions be kept in mind, the sooner we have a college for learning as well as science affiliated to Oxford or Cambridge, in each of our large towns, the better. The Right Honourable W. E. Forster made some wise remarks on the subject in a speech delivered recently at Leeds, which are well worth consideration; and he wound up with a few pregnant questions. Would Leeds with university extension become richer, happier, better? 'It must be remembered,' he said, 'that though knowledge is power, it is not virtue. Knowledge is not the power over one's self, as is ever being exemplified. It is power over nature; it supplies the means to resist others, to escape from tyranny and oppression, but it does not give moral purpose or self-denial.' The education which does not make a man feel that he has a conscience, nor inspire him with a love for earnest work, falls short of its purpose, and must be regarded as a snare.

Knowledge of art is an important element in education, and is susceptible of almost infinite development. Whatever a man's condition, whether he be author or artisan, merchant or musician, he finds advantage in a knowledge of art. Instruction can now be had on very moderate terms in all our large towns, and in some places scholarships are

offered to the most capable students. Among the schools of art now open there is one—the Royal Architectural Museum, Tufton Street, Westminster—which deserves to be widely known. This excellent institution is open freely to visitors; the collection of objects of art is described as magnificent; there are classes for drawing and modelling to which the admission fee is not more than sixpence a week; and during the present session, a class for drawing from the life is to be commenced. The advantages thus liberally offered will, we trust, be appreciated, for the promoters of the Museum are earnestly desirous that its resources should be made use of to the fullest extent.

A department has been added to the Bethnal Green Museum which promises to be highly instructive. In all manufactures, and, indeed, in all dwellings, there is a great deal of waste, some of which is noxious. Art and science are continually trying to discover uses for this waste, and have had much success; and in the new department above referred to, there is a large collection of articles manufactured from waste. Waste silk, cotton, and wool are now converted into clothing or articles of domestic use. Beautiful dyes and exquisite perfumes are obtained from waste coal-tar; cork clippings are manufactured into floorcloth; and many other articles are now 'on view,' as auctioneers say, at Bethnal Green. Any one who discovers a way to utilise waste (old corks, for instance), may reckon on an ample reward.

Oyster-culture makes such good progress in France, that it deserves a word of notice. On the coast of the Channel, along the Atlantic, and in the Mediterranean, the favourable results have inspired new activity, and, as we are informed, petitions for a strip of the foreshores are constantly presented to the Minister of Marine. The extent of artificial oyster-breeding grounds is now nearly four thousand acres, and, with the demand for new concessions, may be regarded as a growing quantity. The results hitherto obtained shew clearly that 'natural oyster-beds and artificial breeding-grounds must be united for better or for worse, to succeed and to fail simultaneously, each serving as a nursery for the other, an exchange of stock, spat, and germs being effected among them.' And to secure uniformity of operation and to prevent waste, 'special instructions have been issued to all maritime authorities to ascertain at what part of their districts experiments may be successfully attempted, under government supervision, for collecting spat and raising marketable oysters.'

As is well known, around our own coasts oyster-beds have been ruined by reckless dredging. But, by the intelligent supervision and careful nursing which prevail in France, the beds have been enriched to a degree that seems wonderful. For example, certain beds in the Arcachon district, which in 1870 were reported as exhausted, yielded in a few hours' dredging, last November, more than forty million marketable oysters. 'So, also at Granville, the fortunate dredgers who had a few free tides granted to dredge over old natural beds earned seven hundred thousand francs by their catch.' With these facts before us, we feel constrained to inquire—Cannot something be done to prevent the destruction of British oyster-beds, and restore their former fecundity?

Messrs Dewar and M'Kendrick of Edinburgh

have made a series of experiments on the physiological action of ozone. Ever since Schoenbein shewed that a mouse shut up in an atmosphere of ozone died in about five minutes, a notion has prevailed that ozone acts in an energetic way on the animal body; but until these experiments were made scarcely anything was known of the subject. The conclusions, as stated by the experimentalists are: '1. That the inhalation of an atmosphere highly charged with ozone diminishes the number of respirations per minute. 2. The pulsations of the heart are reduced in strength, and the heart is found beating feebly after the death of the animal (experimented on). 3. The blood is always found in a venous condition in all parts of the body, both in cases of death in an atmosphere of ozonised air and of ozonised oxygen.' (In this particular the action resembles that of carbonic acid.) '4. Ozone exercises a destructive action on the living animal tissues if brought into immediate contact with them; but it does not affect them so readily if they are covered by a layer of fluid. 5. Ozone acts as an irritant to the mucous membrane of the nostrils and air-passages, as all observers have previously remarked.'

Surgeons in Europe and America are now using raw cotton as a dressing for wounds, and with excellent effect. A layer of cotton spread over a wound or over the surface exposed by amputation, protects the part thoroughly, filters the air, and prevents the access of floating germs, whether poisonous or not. It is important that the cotton be fresh and of good quality; and if it is to be used in a hospital, it should not be previously exposed to the air of that hospital; moreover, a dressing should never be renewed in the foul air of a ward. In time of war and on the battle-field, the cotton would prevent much suffering. 'In civil practice,' as remarked by Dr Van Buren, 'it promises to be useful principally in the large hospitals of great cities, where pyæmia and erysipelas are always liable to become endemic, in preventing the poisoning of open wounds by those diseases, and also by thus enabling surgeons to save limbs which might otherwise require amputation.' The cotton above described is that manufactured in the form of wadding.

In some American hospitals cotton-waste is used instead of sponges in the washing and dressing of wounds. It is of the same kind as that used for the cleaning of engines, and is picked by some of the patients to prepare it for use. 'The advantages which it possesses,' states a Report, 'are, that it is as satisfactory in the dressing of wounds as sponges, and that when once used it can be destroyed.'

The treatment of fevers by application of cold water is growing more into use, and, as is shewn by trustworthy statistics, with good results: where twenty per cent. have died treated in the usual way, not more than four per cent. die under the water treatment. The method may be varied according to the nature of the case, from simple sponging, to wet sheets with friction, and different kinds of baths. The reduction of temperature is speedy, the relief of distressing symptoms is highly beneficial, and by means of the friction, moisture and evaporation from the skin are produced.

In Germany, disturbances and diseases of the stomach are now treated by means of the stomach-pump. The value of this instrument, as we gather from the clinical *Wochenschrift*, published at

Berlin, has been demonstrated in almost all gastric affections, in phthisis, and in cancer. Pure tepid water is pumped into the stomach, and pumped out, whereby the interior is cleansed and soothed. In some cases, medicaments are mixed with the water. For example—bicarbonate of soda when the reaction of the gastric fluid is very acid; permanganate of potassa when the fluids shew signs of decomposition; carbolic acid when there are vegetable parasites; boracic acid as a disinfectant, and tincture of myrrh in atonic dyspepsia accompanied by abundant production of mucus.

In the United States, it has been found that the stomach can be as readily filled and emptied by means of an india-rubber syphon, as by the stomach-pump.

A remarkable instance of a sudden rise of temperature in a mine is recorded in the Proceedings of the Academy of Sciences at Philadelphia. It was in the adit level of a lead-mine in Missouri, where, all at once, the heat rose from sixty degrees to more than a hundred, so that the miners were unable to continue their work. On searching for an explanation, it was found that the earth of the adit contained seventy-five per cent. of sulphate of protoxide of iron, and that the heating had been due to the rapid absorption of oxygen by sulphuret of iron disseminated throughout the earth in a finely divided condition.

At a meeting of the Newcastle-on-Tyne Chemical Society, Mr J. Wallace described an arrangement of a Bunsen burner with which there is perfect combustion of gas. The usual arrangement is reversed, and instead of regulating the pre-admixture of air from below, it is done at the top by back-pressure, by means of an adjustable perforated metallic plate placed over the top of the burner-tube. When the gas is lit, small bright green beads form on the perforations, and above them the flame appears, not a hollow flame with a dark interior, but a flame solid to the centre.

It is a noteworthy achievement to have proved that gas may be burnt completely in large quantities and in such a manner as to render it a useful and profitable fuel under many circumstances where a measured quantity of heat has to be produced. With a furnace comprising a cast-iron gas chamber into which twelve one-inch burners were fixed, Mr Wallace demonstrated his proposition. The combustion was perfect, whatever might be the quantity of gas passing, and was not disturbed by sudden lighting, or turning low, or off. A furnace of this kind, as was explained to the meeting, when placed below a steam-boiler, may be regulated by means of a valve adjusted to move at any given steam-pressure, and thus regulate the supply of fuel (that is, gas) exactly at the rate steam is required. There will be no deposit of soot, nor any 'striking down' of the flame, and no pressure is required beyond that of the ordinary gas supply. A small steam-boiler is indispensable in many laboratories, and in many operations in science and the arts; and with Mr Wallace's furnace such a boiler may be heated and kept under proper control. It has been proved that a boiler of four horse-power may be kept at work with a consumption of gas at the rate of sixpence an hour.

In connection with this subject we may mention that a steamship is building on the Tyne for a trading firm in Russia, who, as paraffine oil is cheap and

abundant in that country, intend to use nothing besides that oil as fuel. A vessel which does not require coal will have more room for cargo than an ordinary steamer.

According to a writer in the *Revue Industrielle*, the world need not be uneasy in prospect of the consumption of all its coal, for explosives will take the place of coal, and supply all the mechanical power required by future generations. A little more than a pound of dynamite, when exploded, would lift from the ground and project a weight of one hundred and sixty thousand kilogrammes. A kilogramme of nitroglycerine exploded in a closed chamber develops a theoretical pressure of two hundred and forty-three thousand atmospheres. The heat developed is in proportion; and we are assured that 'in a single litre of nitroglycerine there is stored up five thousand five hundred horsepower working continuously for ten hours.'

We are told that Egypt was the cradle of science. Certain it is that Egypt has long been asleep, and has of late shewn signs of waking up. A further sign is the establishing of a geographical society at Cairo, under the title *Société Khédiviale de Géographie*. The first meeting was held in June last. Dr Schweinfurth, the well-known traveller, delivered the inaugural address; and the Society have now begun the study of all branches of geography, and are endeavouring to throw light on those parts of Africa of which, at present, little or nothing is known. The results are to be published in a quarterly *Bulletin*.

A zoological society started in Philadelphia three years ago now numbers nearly nine hundred members. Their Gardens extend along the bank of the Schuylkill river, are well laid out, and have handsome buildings for the housing of the birds and other animals, which, as stated in the Society's Report, are worth nearly 50,000 dollars. The Gardens were opened in July 1874, while still unfinished; and in the eight months up to March of the present year, 227,557 visitors passed through the gates.

At a meeting of the Asiatic Society of Japan, at Yokohama, an account was given of the Shinanogawa, a river which drains the three provinces of Shinano, Musashi, and Yechigo. Its length is 250 miles, and in ordinary weather it discharges 1,500,000 cubic feet per minute. The width varies from 1500 to 4000 feet. If kept clear of shoals, it would be a fine channel for commercial purposes.

It appears that Australia is likely to produce precious stones in sufficient quantity to be made available as articles of commerce. In New South Wales, diamonds, sapphires, topazes, hyacinths, and other gems have been found; in the north-west, opals 'of great fire and brilliant colours' have been met with; and we are informed by the Rev. W. B. Clarke, Vice-president of the Royal Society at Sydney, that 'Eastern Australia is what he has often stated, one vast field of mineral wealth. From north to south, and from the coast to the 141st meridian, the western boundary of New South Wales, we know that coal, gold, copper, tin, and in many places lead, and other minerals of less local importance, are found in abundance.'

From experiments made in Australia we learn that the peppermint (*Mentha piperita*) can be grown with profit in many places. One acre of the plant will yield by distillation from ten to twelve pounds of oil; and the best peppermint oil is worth forty

shillings a pound. Price depends on quality, and quality on soil and culture. The best method is said to be to set the plants six inches from each other in rows, and the rows fifteen inches apart. Thus with peppermint, as with sunflowers, an additional resource is offered to enterprising colonists.

The published list of imports into the United Kingdom in 1874 comprises three hundred and eighty-three articles, the value of which is set down at a total of more than three hundred and seventy millions sterling. Among these articles are three hundred and forty million pounds of wool (the largest importation ever known in a single year), nearly fourteen million hundred-weight of cotton, more than forty-one million hundred-weight of wheat, about eleven million hundred-weight each of oats and barley, and of maize more than seventeen million hundredweight. Tea figures at one hundred and seventy million pounds, unrefined sugar at fourteen million hundred-weight, and tobacco at nearly eighty-one million pounds. Of butter we took one million six hundred thousand hundredweight, and of eggs six hundred and eighty millions, at a cost of £2,400,000. These are but a few out of the long list of products, but they convey a very suggestive idea of our manufacturing and consuming capabilities. If to the gross amount we add our exports, the sum-total appears almost incredible.

#### THE GARDEN.

##### A BALLAD IN THE OLD STYLE.

THE face of My Ladye's a garden, I trow,  
Where many a flower in beauty doth blow;  
Forget-me-nots eke in their doublets of blue  
Are those unto which her bright eyes owe their hue;  
And Roses, Carnations, and Lilies, I ween,  
In divers sweet nooks of this garden are seen.

Here Cupid delights him to wanton and play,  
Now throned in a dimple, now starting away,  
A chasing, and kissing each innocent smile  
That fain in that garden would wander awhile.  
But alack! does My Ladye hear ever a word  
That teases or frets her—no sooner 'tis heard,  
Than straightway her lips lose the form of Love's bow;  
And the tips, 'stead of skyward, are pointed below;  
Where lip joins with lip, there is gathered a frown,  
The weight of whose gloom quickly presses adown  
The spot where it rests; and alas for the smile  
Which the sweets of those lips to rest there did beguile.

Its couch is aslant, and it slips into space,  
Unable for longer to sleep on that face—  
As lost is the smile, so the gay sunlight dies,  
The sunlight that leaps from those merry blue eyes;  
Half closed are the lids, which like clouds veil the light,  
And Day in that garden has turned into Night. . . .  
The fiercer the whirlwind, the quicker 'tis o'er;  
The darker the frown, 'tis the sooner no more;  
It passes away, and a smile takes its place,  
The smile which so lately abandoned that face.

Young Cupid soon follows, o'erflowing with fun,  
And happiness reigns, now that anger is done.  
But if that the garden were beauteous before,  
'Tis trebly so now the dark clouds have blown o'er.  
No wonder that Cupid has made it his home,  
For who, having found it, would thence seek to roam?

## STORY OF THE DALRYMPLES.

THE Dalrymples are an old family in Ayrshire, where they attained local distinction as land-proprietors in the fifteenth century. The first of them, however, of any public note was James Dalrymple of Stair, who was a Covenanted captain in the reign of Charles I., and at the termination of his military career, was appointed Professor of Logic in the University of Glasgow. The rule at the time was, that if any professor who was a bachelor married, he had to vacate his chair, but was eligible for re-election. Professor Dalrymple submitted to this arrangement. He married, and was reappointed. The lady whom he chose as his wife was Margaret, eldest daughter and heiress of James Ross of Balneil in Wigtownshire, who brought him an estate of five hundred pounds sterling of yearly rent—a pretty large sum in these days—besides the old mansion of Carsecreugh near Glenluce. This might be called the first step in the family towards high rank. Margaret Ross, who was the prototype of Sir Walter Scott's Lady Ashton, in the *Bride of Lammermoor*, was a politic and high-minded woman, and possessed the ability, as well as the will, to push her family upwards in the social scale.

Possibly at the suggestion of his ambitious wife, but doubtless influenced by his own tastes, Dalrymple resigned his professorship, came to Edinburgh, and entered at the Scottish Bar. It was a hazardous step. The times were out of joint. Dalrymple, however, had a certain suppleness of character which enabled him to weather the storm. At the request of General Monk, Cromwell raised him to be a judge in the Court of Session, and taking his seat on the bench, he assumed the senatorial title of Lord Stair. His creation by Charles II. as a Baronet of Nova Scotia was another step in advance. He was like to have been worsted by being obliged to take the Declaration against Presbytery. But this he got the better of by a dexterous manoeuvre. He took the Declaration, giving at the same time explanations in writing to save his conscientious scruples. The explana-

tions were returned to him as not admissible; but he submitted to the rebuff, and kept his seat as a judge—an incident singularly characteristic of the shuffling policy at the period.

The interest attaching to Sir James Dalrymple, Lord Stair, is much deepened by the domestic tragedy of which the great novelist has made such good use. The true history of this romantic affair is fairly stated in the work of Mr Murray Graham, recently issued from the press, and was briefly as follows: Sir James and his wife, Dame Margaret Dalrymple, had a large family of sons and daughters. Janet, the eldest daughter, had, against the will of her parents, pledged her troth to a poor nobleman, Lord Rutherford. Her mother endeavoured to break off the engagement, and to bring about a marriage with Sir David Dunbar, son and heir of Sir David Dunbar of Baldoon, and who stood in the relationship of nephew to Rutherford. 'Dame Margaret Dalrymple is said to have worked upon her unfortunate child, by insisting on the Levitical law, which declares that a maiden shall be free of a vow which she has vowed, "if her father disallow it in the day that he heareth thereof." She at last prevailed over Janet Dalrymple's gentler disposition and weaker will, who agreed to marry Dunbar. The marriage took place at the Kirk of Glenluce, about two miles from her parents' house at Carsecreugh, on the 12th of August (1669), the bride riding to church behind one of her younger brothers, who long afterwards spoke of the chilly coldness of her hand as it touched his own when holding by his waist. The bridal party remained nearly a fortnight at Carsecreugh, whence the bride was taken on the 24th of August to her husband's house of Baldoon, near the town of Wigtown. A gallantly attired troop of friends accompanied the married pair, and a dramatic entertainment or masque was prepared for them at Baldoon. But, alas! the bride's health suddenly declined and gave way, and she died at Baldoon, probably of a broken heart, on 12th of September following.' The circumstances connected with the death differ materially, it will be seen, from those pictured by

the novelist. The tradition of the event, however, impressed the imagination of Scott, the result being the tale of *The Bride of Lammermoor*. Dunbar afterwards married a daughter of the seventh Earl of Eglintoun, and died in 1682, by a fall from his horse. As for his rival, Rutherford, he obtained a commission in the Household Guards, and died in 1685.

After being ten years a judge, Lord Stair was promoted to be President of the Court of Session, and appointed a member of the Scottish Privy Council. His ability was not alone demonstrated on the bench. He composed the *Institutions of the Law of Scotland*, a work which, with modern annotations, is much prized by the legal profession. The year 1681, in which this great work appeared, was noted for 'the Test,' a religious formula, that Sir James felt himself unable to subscribe. Before he could tender his resignation, he was omitted from a new list of judges, and thereupon retired into private life. Harassed by fears of persecution for being too tenderly inclined to the Covenanters, he quietly removed himself to Leyden, where he found congenial society in Sir Patrick Hume of Polwarth, the Earl of Loudon, and other distinguished refugees. Meanwhile his eldest son, Sir John Dalrymple (who had been knighted in early life), had risen at the bar, and by a strange turn of affairs was, in 1787, appointed Lord Advocate, when Sir George Mackenzie was driven from office for declining to sanction the extreme views of James II. The father and son may now be said to have been on different sides; the son, however, taking anything good that cast up, and holding himself ready for any political change that circumstances required—not a bad prototype of Sir Walter Scott's Lord Turntippet. The circumstances soon came. King James fled; William of Orange landed in England, bringing Sir James Dalrymple in his train, and under the Revolution settlement Sir John, his son, declared himself favourable to the new order of things. Nor did he disdain to occupy the onerous position of Secretary of State for Scotland, a position rendering him responsible adviser to the crown in all Scottish affairs. In 1690, his father being raised to the peerage as Viscount Stair, Sir John was now usually designated Master of Stair. On this Sir John Dalrymple, Master of Stair, and Secretary of State for Scotland, we propose to concentrate attention. Macaulay speaks of him as 'able, eloquent, and accomplished;' he might be all that, but inasmuch as he was the prime instigator of an act of barbaric cruelty, the Massacre of Glencoe, his name has been rendered historically infamous.

At the Revolution, certain Highland clans stood out in a hesitating way for King James, and gave some uneasiness to government. The Earl of Breadalbane was employed to bring about a pacification by means of bribes in money and otherwise; the negotiation being enforced by a royal proclamation in August 1791, intimating a free pardon to all who had been in arms against King

William, provided they should come in any time before the 1st of January next, and swear and sign the oath of allegiance. Those who did not accept these terms were to be treated as enemies and traitors—that is to say, they and all belonging to them would be subject to extirpation by military violence. In the present day, we can hardly understand such a threat, because all offenders against the law are liable to a fair trial, and put on their defence. At that period, however, in Scotland, the letting loose of military on a neighbourhood, in virtue of 'letters of fire and sword,' was still in certain circumstances resorted to, as a short method of doing wholesale execution. Dalrymple fiendishly wished for an opportunity of cutting off a few clans by this brief means of slaughter, as an example and warning to all who entertained hostile feelings to the new government. His letters from the court at London during the remainder of the year, shew that he grudged the merciful terms offered to the Highland Jacobites, and would have been happy to find that a refusal of them justified harsher measures. He really hoped that the Macdonalds of Glencoe, a small clan under a chieftain bearing the subordinate surname of M'Ian, would hold out beyond the proper day. He thought it better that the time of grace expired in the depth of winter, for, as he said in a letter to Colonel Hamilton, 'that is the proper season to maul them, in the cold long nights.' As the chiefs of several clans took the oath of allegiance before the sheriffs of their respective counties within the required time, it seemed probable that the only recusant to be dealt with would be the unfortunate M'Ian. In a dilatory manner the aged chief hung back till it was too late to take the oath according to the prescribed terms. But his failure amounted only to a technical mistake. In reality he had sped to Inverlochry or Fort William before the end of the year, and tendered his oath to the governor there, when, to his dismay, he found he had come to the wrong officer. It was necessary he should go to Inveraray, many miles distant, and there give in his submission to the sheriff of Argyshire. In great anxiety, the old man toiled his way through the wintry wild to Inveraray. He had to pass within a mile of his own house, yet stopped not to enter it. After all his exertions, the sheriff being absent for two days after his arrival, it was not till the 6th of January that his oath was taken and registered. The register duly went thereafter to the Privy Council at Edinburgh, but the name of Macdonald of Glencoe was not found in it. It was afterwards discovered to have been by special means obliterated, though still traceable.

Sir John Dalrymple was delighted to find that poor M'Ian was in his power. In a letter, dated 11th January, addressed to Sir Thomas Livingstone, commander-in-chief of the forces in Scotland, he says: 'Just now, my Lord Argyle tells me that Glencoe hath not taken the oaths; at which I rejoice—it's a great work of charity to be exact in rooting out that — sect, the worst in

all the Highlands; it is very good news here.' Elsewhere he says he obtained that very day a letter from the king concerning the Highland rebels, commanding the troops to cut them off, 'by all manner of hostility,' and for this end to proclaim high penalties to all who should give them assistance or protection. Particular instructions, subscribed by the king, followed on the 16th, permitting terms to be offered to Glengarry, whose house was strong enough to give trouble, but adding: 'If M'Ian of Glencoe and that tribe can well be separated from the rest, it will be a proper vindication of the public justice to extirpate that sect of thieves.' On the same day, Dalrymple himself wrote to Colonel Hill, governor of Inverlochy: 'I shall entreat you that, for a just vengeance and public example, the thieving tribe of Glencoe be rooted out to purpose. The Earls of Argyle and Breadalbane have promised they shall have no retreat in their bounds.' He felt, however, that it must be 'quietly done;' otherwise they would make shift both for their cattle and themselves. There can be no doubt what he meant. If the clan were attacked in open warfare, they might disperse with their cattle, and less or more escape; whereas, if approached quietly and deceitfully, they would be 'rooted out and cut off.'

Here, then, the tribe were to be summarily slaughtered, much in the way in which the inhabitants of back-settlements in America used to be stealthily approached and ferociously killed by bands of Indians. Everything being thus secretly prepared, the commander, Livingstone, wrote to Colonel Hamilton of Inverlochy garrison to proceed with his work against the Glencoe men. 'A detachment of the Earl of Argyle's regiment—Campbells, hereditary enemies of the Macdonalds of Glencoe—under the command of Campbell of Glenlyon, proceeded to the valley, affecting nothing but friendly intentions, and were hospitably received. Glenlyon himself, as uncle to the wife of one of the chief's sons, was hailed as a friend. Each morning, he called at the humble dwelling of the chief, and took his morning-draught of usquebaugh. On the evening of the 12th of February, he played at cards with the chief's family. The final orders for the onslaught, written on the 12th at Ballachulish by Major Robert Duncanson (a relation of the Campbells), were now in Glenlyon's hands. They bore: "You are to put all to the sword under seventy. You are to have a special care that the old fox and his son do on no account escape your hands. You're to secure all avenues, that none escape; this you are to put in execution at five o'clock precisely, and by that time, or very shortly after it, I'll strive to be at you with a stronger party. If I do not come to you at five, you are not to tarry for me, but to fall on."

'Glenlyon was but too faithful to his instructions. His soldiers had their orders the night before. John Macdonald, the chief's eldest son, observing an unusual bustle among the soldiers, took an alarm, and inquired what was meant. Glenlyon soothed his fears with a story about a movement against Glengarry, and the lad went to bed. Meanwhile, efforts were making to plant guards at all the outlets of that alpine glen; but the deep snow on the ground prevented the duty from being fully accomplished. At five, Lieutenant Lindsay came with his men to the house of the

chief, who, hearing of his arrival, got out of bed to receive him. He was shot dead as he was dressing himself. Two of his people in the house shared his fate, and his wife, shamefully treated by the soldiers, died next day. At another hamlet called Auchnaion, the tacksman and his family received a volley of shot as they were sitting by their fireside, and all but one were laid dead or dying on the floor. The survivor entreated to be killed in the open air, and there succeeded in making his escape. There were similar scenes at all the other inhabited places in the glen, and before daylight, thirty-eight persons had been murdered. The rest of the people, including the chief's eldest son, fled to the mountains, where many of them are believed to have perished. When Colonel Hamilton came at breakfast-time, he found one old man alive, mourning over the bodies of the dead; and this person, though he might have been even formally exempted as above seventy, was slain on the spot. The only remaining duty of the soldiers was to burn the houses and harry the country. This was relentlessly done, two hundred horses, nine hundred cattle, and many sheep and goats being driven away.

'A letter of Dalrymple, dated from London the 5th March, makes us aware that the Massacre of Glencoe was already making a sensation there. It was said that the people had been murdered in their beds, after the chief had made the required submission. The secretary professed to have known nothing of the last fact, but he was far from regretting the bloodshed. "All I regret is that any of the sect got away." When the particulars became fully known—when it was ascertained that the Campbells had gone into the glen as friends, and fallen upon the people when they were in a defenceless state, and when all suspicion was lulled asleep—the transaction assumed the character which it has ever since borne in the public estimation, as one of the foulest in modern history.'

Such, in brief, are the particulars of this shameful affair, for which the Master of Stair must chiefly be held responsible. The massacre, no doubt, proceeded in virtue of the king's instructions, but the Secretary Stair was the king's adviser, and, as we have seen, he entertained a rancorous hatred of the Glencoe men. Nothing can shelter him from infamy; yet the annalist of the family attempts to gloss over his conduct by inferring that he 'was unconscious of the unjustifiable severity and atrocity of the act.\* Unconscious of the cruelty of ordering a multitude of human beings to be deceitfully thrown off their guard and butchered like wild beasts! The fact is, Sir John Dalrymple became ashamed, and somewhat alarmed for what he had done. In our own times an act like that of the Massacre of Glencoe would be known all over the world in four-and-twenty hours. On its occurrence, so slowly did news travel, that the affair was only beginning to be talked of in Edinburgh and London some months afterwards, and did not become matter of public clamour until 1695. A royal commission was that year appointed to inquire into the facts of the case, the result being that Secretary Stair was blamed for having

\* *Annals and Correspondence of the Viscount, and the First and Second Earls of Stair.* By John Murray Graham. 2 vols. 8vo. Blackwood and Sons. 1875.

exceeded his instructions. He resigned office, and the king granted remission for his excess of zeal. As a further act of royal condescension, when Dalrymple became second viscount by the decease of his father in 1695, he was created Earl of Stair—a curious instance of a great wrong being rewarded by an accession of honours.

The first Earl of Stair did not long enjoy his new honours. Aware of the odium he had incurred by the Glencoe massacre, and worn down by political manœuvring and debates in favour of the Union, he died suddenly on the 8th January 1707. So here was an end of one of the cleverest, and, we may say, the cunningest and least scrupulous men of his day. There was a moral in his fate. His greatness as a statesman was tarnished by an act of profound villainy, which no apology can extenuate. Of what worth are the highest earthly honours when associated with the reputation of despicable baseness?

Sir John Dalrymple made what is called a good marriage. Early in life, he was married to Elizabeth, daughter and heiress of Sir John Dundas of Newliston, and had several sons, the eldest of whom, when a boy, was accidentally killed by his next youngest brother, then a child of eight years of age. Two loaded pistols happened to be lying in the entrance-hall at Carscrough. The boy took up one of the pistols, and unwittingly shot his brother dead. This youthful homicide lived to be his father's successor, as second Earl of Stair. Attaching himself to military pursuits, he became a distinguished officer in the army under Marlborough. He rose to the rank of field-marshal, and afterwards figured as ambassador-extraordinary to the court of Louis XIV. Latterly, he retired to his estate of Newliston, where he is reputed to have been the first in Scotland to plant cabbages and turnips in the open fields—a circumstance more honourable to his memory than all his other public services. He was likewise a great planter of trees and land-improver at his estate of Newliston, and at Castle Kennedy. There is a current tradition that the woods at Newliston were laid out by him in divisions, to resemble the relative positions of the English and French armies at the battle of Dettingen. Mr Murray Graham gives another, but not very dissimilar account of this arboricultural effort. 'The grounds,' he says, 'immediately about the house of Newliston, were laid out by Lord Stair in straight lines, with sunk fences and bastions, in the form of an encampment or fortified position; while the more distant grounds and woods were planted out also in straight lines, in the French taste of the time, with intersecting and corresponding avenues.' Newliston was latterly disposed of to another proprietor. His lordship's taste in ornamentation by trees and otherwise, was carried to still greater length at Castle Kennedy, near the shore of Loch Ryan.

Mr Graham presents numerous particulars concerning the military and diplomatic career of the second Earl of Stair; but for these we must refer to the book itself, which is a painstaking memorial of the early and more conspicuous members of the Dalrymple family. In his latter days, during his retirement from official duties, besides amusing himself as a land improver, the second earl spent much of his time in Edinburgh. Here he fell in love with a lady of local note, widow of the profligate

James Viscount Primrose, whose decease, in 1706, was a relief to her ladyship. She was still a beautiful woman, and might have procured a choice of husbands among the *élite* of the period. She, however, from her unfortunate experiences, made a resolution never again to be a wife. By an exceedingly unworthy trick, related in the *Traditions of Edinburgh*, Lady Primrose was induced to alter her resolution, and become Countess of Stair—her residence at the time imparting the name of Lady Stair's Close to one of the dingy alleys of the Old Town. Her ladyship was more happy with her second husband than with her first. Her only source of vexation was Lord Stair's proneness to excessive drinking. In one of his drunken fits he so far exceeded the bounds of reason and gentlemanly conduct as to give her so severe a blow upon the upper part of the face, as to occasion the effusion of blood. He immediately afterwards fell asleep, unconscious of what he had done. Overwhelmed by a tumult of bitter feeling, Lady Stair made no attempt to bind up her wound; but remained near her torpid husband, and wept and bled till morning. When his lordship awoke, and learned that the cause of his wife's dishevelled and bloody figure was his own conduct, he was so stung by remorse as never afterwards to take any species of drink except what was sanctioned by her ladyship. In this incident we see the type of those scenes of brutal violence which now prevail alone among the most ignorant of the community. Lord Stair died in 1747, and his venerable lady, after being long at the head of Edinburgh society, died in November 1759. Since the decease of the second earl, the title and estates have passed from one branch of the Dalrymple family to another, but concerning whom there is little general interest.

For a long time there was a superstitious belief in Scotland that the wickedness of the Glencoe massacre was visited by retribution on the descendants of its principal actors. As regards the Dalrymples, they in time ceased to be reproached with the unhappy family stain, though until this day it can hardly fail to be to them a matter of regret. The Campbells of Glenlyon appear to have felt more acutely that the sins of the fathers are visited on the children. In their case the Nemesis which follows wrongdoing of all sorts has been the subject of painful remark.

Colonel Stewart, in his account of the Highland regiments, mentions that Colonel Campbell of Glenlyon, who was grandson of the Glenlyon who commanded the military at the Massacre of Glencoe, felt as if under a blight from the conduct of his ancestor. Stewart relates the following anecdote of him. In 1771 he was, as an officer in a regiment, commanded to superintend the execution of the sentence of a court-martial on a soldier condemned to be shot. A reprieve was sent, but the ceremony of the execution was to proceed until the criminal was on his knees with a cap over his head. No person was to be told previously, not even the firing-party, who were warned that the signal to fire would be the drawing of a white handkerchief out of the officer's pocket. Campbell put his hand into his pocket to draw out the reprieve, but at the same time accidentally drew out the handkerchief. The party fired, and the soldier was shot dead. The paper dropped through Campbell's fingers, and, placing his hand to his

forehead, he exclaimed: 'The curse of God and Glencoe is here; I am an unfortunate, ruined man.' He soon after retired from the service, and the impression on his mind was never effaced. There are other legends regarding the supposed hereditary blight still resting on the Glenlyon family.

W. C.

## THE FLAG OF DISTRESS.

## CHAPTER XXXVII.—TWO 'SYDNEY DUCKS.'

JACK STRIKER and Bill Davis are two 'Sydney Ducks,' who have seen service in the chain-gangs of Australia. They have also served as sailors, this being their original calling. But since a certain voyage to the Swan River settlement—in which they were but passengers, sent out at the expense of H. B. Majesty's government—they have had aversion to the sea, and only take to it intermittently, when under the necessity of working passage from port to port for other purposes. Escaping from a colonisation forced upon them, and quite uncongenial, they had thus made their way into California; and, after a trip up the Sacramento, and a spell at gold-seeking with but indifferent success, had returned to San Francisco; in the Queen City of the Pacific, finding ways of life they liked better than the hard labour of pick, pan, and cradle. Loafing among its low sailor-haunts, they encountered a pleasant surprise, by meeting a man who offered them five thousand dollars each to ship in a merchant-vessel, for the 'short trip' to Panama! A wage so disproportioned to the service asked for, of course required some explanation; which the princely contractor gave, after having secured their confidence. It proved satisfactory to the Sydney Ducks, who, without further questioning, entered into the contract. The result was their getting conducted aboard the *Condor*—she being the vessel bound for the port of Panama.

He who had given them this handsome engagement was not the owner of the ship; no more was he her captain or supercargo; but a gentleman representing himself authorised to accept their services for a somewhat different purpose than the mere working of her sails, and who promised to pay them in a peculiar manner—under certain contingencies, even more than the sum stipulated, notwithstanding its magnificence. The strange conditions were partially made known to them before setting foot on the ship; and though an honest sailor would have scornfully rejected them—even in the face of such tempting reward—Jack Striker and Bill Davis accepted them without scruple or cavil. For they are not honest sailors, but ex-convicts, criminals still unreformed, and capable of any misdeed—piracy, or murder—if only money can be made thereby.

Since coming aboard the *Condor* and mixing with others of her crew, they have had additional insight into the character of their contract, and the services required of them. They find that several other men have been engaged in a somewhat similar way, and at a like bounteous wage; for a while wondering at it, till, after a mutual comparison of notes, and putting together their respective scraps of intelligence, with surmises added, they arrive at a pretty accurate understanding of how the land lies, and why their *entre-*

*preneur*—who is no other than the second-mate, Padilla—has been so liberal.

Striker, who has seen more of the world, and is the elder of the two Sydney Ducks, has been the first to obtain this added information; and it is for the purpose of communicating it to his old chum of the chain-gang, he has asked the latter to step aside with him. And chancing to be cast together in the middle watch, an opportunity offers, which the older convict has all that day been looking out for.

Davis, of more talkative habit, is the first to break silence; which he does on the instant of their coming under the awning.

'Well, old pal! What d'ye think of our present employ? Better than breakin' stone for them Swan River roads, with twenty pound of iron chain clinkin' at a fellow's feet. An't it?'

'Better'n that, yes; but not's good as it might be.'

'Tut, man, you're always grumblin'. Five thousand dollars for a trip that isn't like to run up to a month; not more than a fortnight or three weeks, I should say! If that don't content you, I'd like to know what would.'

'Well, mate; I'll tell 'ee what wud. Thirty thousand for the trip. An' Jack Striker an't like to be saterfied wi' anythin' short o' that sum.'

'You're joking, Jack?'

'No, I an't, Bill. As you knows, I'm not o' the jokin' sort; an' now mean what I say, sartin as I ever meant anythin' in my life. Both me an' you oughter get thirty thousand apiece o' this yellow stuff—that at the werry leest.'

'Why, there wouldn't be enough to go round the lot that's in.'

'Yes, thar wud, an' will. Old as I im, I hain't yit quite lost hearin'. My yeers are as sharp as they iver wor, an' jist as reliable. Larst night I heerd a whisper pass atween Padilla an' another o' them Spanish chaps, that's put me up to some-think.'

'What did you hear?'

'That the swag'll tot up to the total o' three hundred thousand dollars.'

'The deuce it will. Why, they said it wasn't half that much! Padilla himself told me so.'

'No matter what he's told you. I tell ye now, it's all o' the six figures I've sayed. In coorse it's their interest to make it out small as they possibly can, seein' as our share's to be a purcentage. I know better now, an' knowin' it, an't agoin' to stan' none o' theer nonsense. Neyther shud you, Bill. We both o' us are 'bout to risk the same as any o' the tothers.'

'That's true enough.'

'In coorse it is. An' hein' so, we oughter share same as them; can, an' will if we stick well the-gither. It's jist as eazy one way as tother.'

'There's something in what you say, mate.'

'Theer's everythin' in it, an' nothin' more than our rights. As I've sayed, we all risk the same, an' that's gettin' our necks stretched. For if we make a nucker o' the job, it'll be a hangin' matter, sure. For I dar say theer's got to be blood spilt afore it's finished.'

'What would you advise our doing? You know, Jack, I'll stand by you, whatever you go in for.'

'Well, I want it to be a fair divide, all round; detarmined it shall be. Why shud the

four Spanish fellas get a dollar moren us others? As I've observed, two o' them, Gomez an' Hernandez, have set their eyes on the weemen folks. It's eezy to see that's part o' their game. Beside, I heerd them talkin' o't. Gomez be arter the light girl, an' Hernandez the dark un. Well, they may do as they like, for all I care. But that are all the more reezun why they oughten be so greedy 'bout the shinin' stuff. As for Mister Gomez, it's plain he's the head man o' the lot; an' the second-mate, who engaged us, is only like the others, an' 'pears to be controlled by him. 'Twar tween them two I overheard the confab; Gomez tellin' Padilla that the dust lyin' snug in the cabin lockers was full valley for three hunderd thousan'. An' as theer's eleven o' us to share, that 'ud be nigh on thirty thousan' apiece, if my 'rithmetic an't out o' reckinin'. Bill Davis, I say, we oughter stan' up for our rights.'

'Certainly we should. But there'll be difficulty in getting them, I fear.'

'Not a bit—not a morsel, if we stick out for 'em. The four Spaniards means to go snacks 'mong themselves. But theer be seven o' us outsiders; an' when I tell the others what I've told you, they'll be all on our side—if they an't the silliest o' fools.'

'They won't be that, I take it; a difference of twenty thousand dollars or so in their favour, will make them sensible enough. But what's to be the upshot, or, as they call it in the theatre play-bills, what's the programme?'

'Well, mate; so far as I've been put up to't, we're to run on till we get down the coast, somewhere near the Isthmus o' Panyma. Theer we'll sight land, an' soon's we do, the ship's to be scuttled, we first securin' the swag, an' takin' it ashore in one o' the boats. We're to land on some part o' the coast that's known to Gomez, he says. Then we're to make for some town, when we've got things straight for puttin' in appearance in a explainable way. Otherways, we might get pulled up, an' all our trouble 'ud be for nowt. Worse, every man jack on us would have a good chance to swing for t.'

'And the young ladies?'

'They're to go along wi' Gomez an' Hernandez. How they mean to manage it, Jack Striker can't tell ya. They'll be a trouble, no doubt, as always is wi' weemen, an' it be a pity we're hampered wi' 'em; moren that, it's reglar dangerous. They may get the hul kit o' us into a scrape. Hows- ever, we'll hev to take our chances, since theer's no help for it. The two chaps 'pear to be reglar struck with 'em. Well, let 'em carry off the gurls an' welcome. As I've sayed, thet oughter make 'em less objectin' to a fair divide o' the dust.'

'What's to be done with the others—the old Spaniard and skipper, with the black cook and first-mate?'

'They're to go down wi' the ship. The intention is, to knock all o' 'em on the head soon's we come in sight o' land.'

'Well, Jack; for the first three I don't care a brass farthing. They're foreigners and blacks; therefore, nothing to us. But, as Blew chances to be a countryman of ours, I'd rather it didn't go so hard with him.'

'Baldertash! Bill Davis! What have you or me to do wi' feelins o' that sort? Countryman, indeed! A fine country, as starves ten millions

o' the like o' us two; an' if we try to take what by nateral right's our own, sends us out o' it wi' handcuffs round our wrists, an' iron jewelry on our ankles! All stuff an' psalm-singin' that 'bout one's own country, an' fella-countrymen. If we let him off, we might meet him somewhere when we an't a-wantin' to. He'll have to be served same as the tother three. There be no help for't, if we don't want to have the hemp roun' our thrapples.'

'I suppose you're right, Striker; though it does seem a pity too. But what reason have the Spaniards for keepin' the thing back? Why should they wait till we get down near Panama? As the yellow stuff's lyin' ready, sure it might be grabbed at once, an' then we'd have more time to talk of how it's to be divided? What's the difficulty about our taking it now?'

'Tan't the takin' o't. That'll be eezy work; an' when the time comes, we'll have it all our own way. We could toss the four overboard in the skippin' o' a flea. But then, how's the ship to be navvigated without the skipper an' first-mate?'

'Surely we can do without them?'

'That's jest what we can't. O' all our crew, theer's only them two as hev the knowledge o' charts an' chronometers, an' the like; for him's as is actin' second confesses he don't know nothin' 'bout sich. Tharfor, though we're in a good soun' craft, without the skipper, or Blew, we'd be most as good as helpless. We're now on the biggest o' all oceans, an' if she stood on the wrong tack, we might never set eyes on land—or only to be cast away on some dangersome shore. Or, what 'ud be bad as eyther, get overhauled by some man-o'-war, an' not able to gie account o' ourselves. Theer's the difficulty, don't 'ee see, Bill? So, the Spaniards hev agreed to let things alone till we've ran down nigh Panyma. Theer Gomez says theer be a long stretch o' uninhabited coast, where we'll be safe goin' ashore in the night.'

'Well, I suppose that'll be the best way, after all. If a man has the money, it don't make much difference where he sets foot on shore; an' no doubt we'll find sport down at Panyma good as anywhere else.'

'Theer ye be right, Bill. When a cove's flush there's pleaurin' everywhere. Gold's the only thing as gives it.'

'With the prospect of such big plunder, we can afford to be patient,' says Davis, resignedly.

'I an't agoin' to be patient for the paltry five thousand they promised. No, Bill; neyther must you. We've equal rights wi' the rest, an' we must stick out for 'em.'

'Soon as you say the word, Jack, I'm at your back. So'll all the others, who're in the same boat with ourselves.'

'They oughter, an' belike will; tho' theer's a weak-witted fool or two as may take talkin' into it. I means to go at 'em at once, soon's I've finished my trick at the wheel, the which'll soon be on. Ay! theer's the bell now; I must go aft. When I come off, Bill, be you up by the night-heads, an' have that Dutch chap as is in our watch 'long wi' ye; an' also the Dane. They're the likeliest to go in wi' us at once, an' I'll first broach it to them.'

'All right, old pal! I'll be there.'

The two plotters step out from under the awning; Striker turning aft to take his 'trick' at the

wheel, the other sauntering off in the direction of the fore-castle.

Harry Blew stands aghast—his hair on end, the blood coursing chill through his veins. No wonder, after listening to such a revelation! A plot diabolical—a scheme of atrocity unparalleled—comprising three horrible crimes: robbery, the abduction of women, and the murder of men. Among these, himself!

Now knows he the cause of the crew's insubordination; too clearly comprehends it. Three hundred thousand dollars of gold-dust stowed in the cabin-lockers! News to him; for Captain Lantanas had not made him acquainted with the fact—the treasure having been shipped before his coming aboard; in fact, on that same night when he went after Silvestre. At the very time he was knocking at the ship-agent's office-door, Don Tomas, with some trusty watermen, were engaged in getting it aboard the Chilhan ship.

An unfortunate arrangement, after all, and now too certain of ending disastrously, not only for Don Gregorio, but those dear to him, with others less interested, yet linked to his fate. Though the ex-man-of-war's-man is neither doubtful nor incredulous of what he has just heard, it is some time before his mind can grasp all the details. So filled is he with astonishment, it is natural his thoughts should be confused, and himself excited. But soon he reflects calmly; and, revolving everything over, perceives clearly enough what are the crimes to be committed, with the motives for committing them. There can be no ambiguity about the nature of the nefarious conspiracy. It has all been hatched and prearranged on shore; and the scoundrels have come aboard specially for its execution. The four Spaniards or Californians, as he believes them to be—must have had knowledge of the treasure being shipped, and, in their plan to appropriate it, have engaged the others to assist them. Striker's talk has told this; while revealing also the still more fiendish designs of abduction and murder.

The prospect is appalling; and as he reflects upon it, Harry Blew feels his heart sunk within him, strong though that heart be. For a dread fate is impending, over himself, as well as those he has promised to protect.

How is it to be averted? How is he to save them? How save himself?

These questions come crowding together, and repeat themselves over and over, but without suggesting answer. He cannot think of one that is satisfactory; he sees no chance of escape. The crew are all in the plot—every man of them—either as principals or engaged assistants. The conversation of the two convicts has shewn this. The second-mate same as the rest; which to him, Harry Blew, causes no surprise. He had already made up his mind about Padilla; observing his sympathy with those who had begun to shew insubordination. He had also noticed, that in whatever was up among them, Gil Gomez was the directing spirit; Velarde next in influence; both dominating Padilla, notwithstanding his superior authority as one of the ship's officers; while Hernandez seemed to be controlled by all three. The last, Harry Blew has discovered to be a landsman, with no sea-experience whatever; when found out, excusing himself on the plea that he wished to work his passage to Panama. The position of the

other seven is understood by what Striker said. All are in the scheme of pillage and murder—though not to be equally rewarded.

Bringing them one after another before his mind; recalling his experience of them—which, though short, has given him some knowledge of their character—the *Condor's* first officer cannot think of one likely to take sides with him. They are all men of iniquity; and in defending the innocent he would have to stand alone. For it would amount to almost that, with no other help than Captain Lantanas, Don Gregorio, and the cook; the first, a slight slender man, with just strength enough to handle a telescope; the second, aged, and something of an invalid; the third, for fighting purposes, scarce worth thinking of. His fidelity could be depended upon to the death; but he is also an oldish man, and would count for little in a conflict with such desperadoes as those who design making themselves masters of the ship.

All these points present themselves to the mind of the first-mate, clearly, impressively. A thought of telling Captain Lantanas what he has discovered, and which came naturally, he no longer entertains. The trusting Chilhan skipper would scarce give credit to such an atrocious scheme. And if he did, in all likelihood it would result in his taking some rash step, that would but quicken their action, and bring sooner on the fatal catastrophe. No; 'twill never do to make him acquainted with the danger, great as it is. Nor yet should Don Gregorio know of it. The terrible secret must be kept from both, and carefully. Either of them aware of it, and in an hour after, all might be over—the tragedy enacted, and its victims consigned to the sea—himself, Harry Blew, being one of them.

Still crouching under the sail, he trembles, as he conjures up the picture of that fearful fate that seems so certainly before him. In the midst of the open ocean, or close to land, the scene will be all the same. The girls seized; the captain, Don Gregorio, the cook, and himself, shot down, or pommaded; after that, the gold dragged out of the lockers; the vessel scuttled, and sunk; a boat alone left to carry the pirates ashore, with their spoils and captives! Contemplating such a scene

even only in imagination—it is not strange that the *Condor's* first-officer feels a shivering throughout his frame. He feels it in every fibre. And reflection fails to give relief; since it suggests to him no plan for saving himself. On the contrary, the more he dwells on it, the more he sees the danger—sees it in all its stark naked reality. Against such odds a conflict would be hopeless. It could only end in death to all who have been singled out, himself perhaps the first.

For a time he stands in silent cogitation, with despair almost paralyzing his heart. He is unable to think steadily or clearly. Doubtful, unfeasible schemes shape themselves in his mind, or idle thoughts flit across his brain—all the while wild emotions coursing through his soul.

At length, and after prolonged reflection, he makes a resolve. As his face is in shadow, its expression cannot be seen; but, judging by the words that are muttered by his lips, it is one that should be unworthy of a British sailor—in short, that of a traitor. For his soliloquy seems to shew that he has yielded to craven fear—intends surrendering up the sacred trust reposed in him, and along with it his honour!

The words are :

'There's no chance for that, nor yet for the savin' of my own life—except by castin' my lot in along wi' them. I'll do it—I'll do it!'

#### CHAPTER XXXVIII.—PLOT UPON PLOT.

The *Condor* is sailing with a light breeze some points abaft the beam. Jack Striker is at the helm; and as the sea is smooth, he finds it easy steering, having little to do but keep her steady by taking an occasional squint at the compass-card. The moon—which has just risen—shining in his face, shews it to be that of a man over fifty, with the felon in its every line and lineament. It is beardless, peck-pitted, with thick shapeless lips, broad hanging jowls, nostrils agape, and nose flattened like the snout of a bull-dog. Eyes green, both bleary, one of them blood-shot. For all, eyes that, by his own boast, can 'see into a millstone as far as the man who picks it.' He has not been many minutes at his post, when he sees some one approaching from the waist of the ship; a man, whom he makes out to be the first-mate.

'Comin' to con me,' growls the ex-convict. 'Don't want any o' his connin', not I. Jack Striker can keep a ship on her course well's him, or any other 'board o' this craft.'

He is on the starboard side of the wheel, while the mate approaches along the port gangway; who, after springing up to the poop-deck, stops opposite the steersman.

'Well, Striker,' he says; 'not much trouble with her to-night. She's goin' free too, with the wind in the right quarter. We ought to be makin' good nine knots!'

'All o' that, I darsay, sir,' rejoins Striker, mollified by the affable manner in which the first-officer has addressed him. 'The barge an't a bad un to go, though she be a queery-rigged craft as ever I war aboard on.'

'You've set foot on a goodish many, I should say, judgin' from the way ye handle a helm. I see you understan' steerin' a ship.'

'I oughter, master,' answers the helmsman, further flattered by the compliment to his professional skill. 'Jack Striker's had a fair show o' schoolin' to that bizness.'

'Been a man-o'-war's man, han't ye?'

'Ay, all o' that. Any as doubts it can see the warrant on my back, an' welcome to do so. Plenty o' the cat's claws theer, an' I don't care who knows it.'

'Neyther need ye. Many a good sailor can shew the same. For myself, I han't had the cat, but I've seed man-o'-war service, an' got rough treatment too. An' I've seed sarvice on ships man-o'-war's men have chased—likin' that sort a little better; I do.'

'Indeed!' exclaims the ex-convict, turning his eyes with increased interest on the man thus frankly confessing himself. 'Smuggler? or maybe slaver?'

'Little bit o' both. An' as you say 'bout the cat, I don't care a toss-up who knows o't. It's been a hardish world wi' me; plenty o' ups an' downs; the downs of'ener than the ups. Just now things are lookin' sort o' uppish. I've got my berth here 'count o' the scarcity o' hands in San Francisco, an' the luck o' knowin' how to take

sights, an' keep a log. Still, the pay an't much, considerin' the chances left behind. I darsay I'd 'a done a deal better by stayin' in Californy, an' goin' on to them gold-diggin's up in the mountains.'

'You han't been theer, han't ye?'

'No. Never went a cable's length ayont the town o' San Francisco.'

'Maybe, jest as well ye didn't, Master Blew. Me an' Bill Davis tried that dodge; we went all the way to the washin's on Feather River; but foun' no gold, only plenty o' hard work, wi' precious little to eat, an' less in the way o' drink. Neyther o' us likin' the life, we put back for the port.'

For all his frankness in confessing to the cat-o'-nine-tails on board a war-ship, Striker says nothing about a rope of a different kind he and his chum Davis were very near getting around their necks on the banks of that same Feather River, and from which they escaped by a timely retreat upon San Francisco.

'Well,' rejoins Blew, in a tone of resignation; 'maybe I've did the wisest thing after all, in not goin' that way. I might 'a come back empy-handed, same as yourself an' Davis. Ye say liquor was scarce up there. That would never 'a done for me. I must have my reg'lar allowance, or—— Well, no use sayin' what. As an old man-o'-war's man, you can understan' me, Striker. An' as the same, I suppose you won't object to takin' a tot now?'

'Two, for that matter,' promptly responds Striker, like all his kind, drouthy.

'Well; here's a drop o' run—the best Santa Cruz. Help yourself!'

Harry Blew presents a black-jack bottle to the helmsman, who, detaching one hand from the wheel, takes hold of the bottle, and carries it to his lips. After keeping it there for a prolonged spell, he returns it to its owner, who, for the sake of sociability, takes a drink himself. This done, the dialogue is renewed, and progresses in even a more friendly way than before, the Santa Cruz having opened the heart of the 'Sydney Duck' to a degree of familiarity; while, on his side, the mate, throwing aside all reserve, lets himself down to a level with the foremastman. It ends in their establishing a confidence, mutual and complete, of that character known as 'thickness between thieves.' Blew first strikes the chord that puts their spirits *en rapport*, by saying:

'Ye tell me, Striker, that ye've had hard times, an' some severe punishment. So's had Harry Blew. An' ye say ye don't care about that. No more says he. In that we're both o' us in the same boat. An' now we're in the same ship—you a sailor afore the mast, I first-officer. But for all the difference in our rank, we can work together. An' there's a way we can both o' us do better. Do you want me to tell it ye?'

'Ay, ay; tell it. Jack Striker's ears are allus open to hear how he can better his sittivation in life. He's a listener.'

'All right. I've observed you're a good hand at the helm. Would ye be as good to go in for a job that'll put a pile o' money in your pocket?'

'That depends. Not on what sort o' a job. I don't mean that. But what money—how much?'

'Puttin' it in gold, as much as you can carry; ay, enough to make you stagger under it.'

'An' you ask if I'm good for a job like that?'

Werry funny questyin thet be; 'specially puttin' it to ole Jack Striker. He's good for't, wi' the gallows starin' him full in the face. Darned if he an't!

'Well; I thought you wouldn't be the one to be basket-faced 'bout it. It's a big thing I have on hand, an' there'll be a fortune for all who go in wi' me.'

'Shew Jack Striker the chance o' goin' in, an' he'll shew you a man as knows no backin' out.'

'Enough, shipmate. The chance is close to hand; aboard o' this ship. Below, in her cabin lockers, there's stowed somethin' like half a ton o' glitterin' gold-dust. It belongs to the old Spaniard that's passenger. An' what's to hinder us to lay hands on it? If we can only get enough o' the crew to say yes, there needs be no difficulty. Them as won't 'll have to stan' aside. Though, from what I see o' them, it's like they'll all cut in. Divided square round, there'll be between twenty an' thirty thousand dollars apiece. Does that tempt ye, Striker?'

'Rayther. Wi' thirty thousand dollars I'd ne'er do another stroke o' work.'

'You needn't, then. You can have all o' that, by joinin' in, an' helpin' me to bring round the rest. Do you know any o' them you could sound—with safety, I mean?'

'Two or three. One surtin; my ole chum, Bill Davis. He can be trusted wi' a secret o' throat-cuttin'; let alone a trifle such as you speak o'. An' now, Master Blew, since you've seed fit to confide in me, I'm agoin' to gie ye a bit o' my confidence. It's but fair atween two men as hev got to understand one the tother. I may's well tell ye, that I knew all about the stuff in the cabin lockers. Me an' Davis war talkin' o't jist afore I come to the wheel. You an't the only one as hez set their heart on hevin' it. Them Spanish chaps hez got it all arranged aready—an' had afore they put fut 'board this heer barque. Thar's the four on 'em, as I take it, all standin' in equal; whiles the rest o' the crew war only to get so much o' a fixed sum.'

'Striker, ye 'stonish me!'

'Well, I'm only tellin' ye what be true. I'm glad you're agreeable to go in wi' us; the which 'll save trouble, an' yer own life as well. For I may tell ye, master, that they'd made up thar minds to send ye to the bottom, 'long wi' the skipper an' the ole Spaniard.'

'That's a nice bit of news to hear, by Jove! Well, mate, I'm thankful to ye for communicatin' it. Lor! it's lucky for me we've this night chanced to get talkin' thegither.'

'Thar maybe luck in't all roun'. Bill an' me 'd made up our minds to stan' out for a equal divide o' the dust—like shares to ivery man. Shud there be any dispute 'bout that bein' fair, wi' you on our side, we'll eezy settle it our way, spite o' them Spaniards. If they refuse to agree, an' it come to fightin', then Jack Striker's good for any two on 'em.'

'An' Harry Blew for any other two. No fear but we can fix that. How many do you think will be with us?'

'Most all, I shud say, 'ceptin' the Spaniards themselves. It concerns the rest same's it do us. Tall events, we're bound to ha' the majority.'

'When do you propose we shud begin broachin' it to them?'

'Straight away, if you say the word. I'll try

some o' 'em soon 's I've went off from here. Thar be several on the watch as 'll be takin' a tot together 'fore we turns in. No time better nor now.'

'True. So at them at once, Striker. But mind ye, mate; be cautious how ye talk to them, an' don't commit ayther of us too far, till you've larnt their temper. I'll meet ye on the first dog-watch to-morrow. Then you can tell me how the land's likely to lie.'

'All right. I'll see to't in the smooth way. You can trust Jack Striker for that.'

'Take an'other pull o' the Santa Cruz. If this trip prove prosperous in the way we're plannin' it, mayther you nor me 'll need to go without the best o' good liquor for the rest o' our lives.'

Again Striker clutches at the proffered bottle, and holds it to his head—this time till he has drained it dry. Returned to him empty, Harry Blew tosses it overboard. Then parting from the steersman, he commences moving forward, as with the design to look after other duties. As he steps out from under the shadow of the spanker, the moon gleaming athwart his face, shews on it an expression which neither pencil nor pen could depict. Difficult indeed to interpret it. The most skilled physiognomist would be puzzled to say, whether it is the reproach of conscious guilt, or innocence driven to desperation.

## WONDERS IN CARVED WORK.

NUMEROUS as have been the descriptions of works of art in carving, and subjects of a similar nature, which we find in books of travel or science, it is still difficult to exhaust this subject, and many art treasures still exist that are but little known, and which yet remain to be described. They consist of stone, marble, wood, ivory, and other substances; and it may prove interesting if some of the more remarkable of these objects are brought out of their obscurity, confining ourselves entirely to such as are comparatively little known, or are almost entirely unknown.

Perhaps the most singular, and certainly the most gigantic of the objects that we shall have to describe, is in stone, and has been mentioned by Colonel Welsh in his *Military Reminiscences of the East Indies* (1830). It was found at a military post called Nungydeo, in Mysore, a southern province of Hindustan. After ascending several stairs in the rock, he came upon a large building of stone, above which he discovered a finely formed image, carved out of one solid stone, and about seventy feet high, representing a young man with wreaths of laurel winding from his ankles to his shoulders, every leaf of which was so exquisitely cut as to bear the closest examination. That it was cut out of the solid rock, could not admit of a doubt, for no power on earth could move so massive a column as to place it on the top of a steep and slippery mountain; so steep, that Colonel Welsh stated that he could not see the statue until he had ascended close to it. The legs were cut out in proportion to the rest, but were attached to a large fragment of the rock behind them, and which was concealed by the buildings which formed the back wall. He says that never in his life did he behold so great a curiosity; every feature being most admirably finished; and owing to the nose inclining

to aquiline, and the under lip being very prominent and pouting, the profile is shewn to the greatest advantage. Every part from top to toe is smooth and highly polished. He could scarcely believe that the hand of man could have accomplished such a work, and that too on the summit of a sterile rock. No person on the spot appeared to know, or care, when, or how, or by whom it was made; and though Nungydeo was the usual appellation, the Brahmins called it Gometranz, or Gomethiz, and at a distance it looked like a stone pillar.

This statue is likewise mentioned by the Rev. H. Caunter, in the *Oriental Annual* for 1836, though he scarcely touches on the beauty of the carving. He states that it is thirty miles north of Seringapatam, the capital of the Mysore, near a village called Savrana Belgula. It is said by the natives to be an image of Gomuta Raya, the chief idol of the Jains, a sect differing in many particulars from the Brahminical and Buddhist forms of worship, which perhaps accounts for the Brahmins knowing but little concerning it. That part of the Mysore was formerly the principal seat of the sect of the Jains, once so prevalent in Hindustan, and this idol is a remarkable memorial of them. Mr Caunter also mentions that it stands seventy feet three inches high, from the summit of a hill of granite upwards of two hundred feet in height. Both statue and pedestal are formed of one stone, and it is supposed that the former originally formed the cone of the mountain, which the sculptor converted into an image, by hewing away the lateral substance of the rocky hill. He only slightly alludes to its being 'elaborately carved,' but mentions, as did Colonel Welsh, the grand appearance of the statue when it suddenly appears, unperceived until close to it, starting up into the sky. It was in perfect preservation in 1836; and many as are the colossal statues in India—though only near Cabul, we believe, are any of a larger size—there are none that can equal that of Gomuta Raya, as they have unfortunately been mutilated and injured to so great a degree as to be incapable of detailed description. This remarkable statue does not appear to be generally known to English residents, as a gentleman who had been twenty-five years in India has told us that he had never heard of it until Mr Caunter's account was written. Nevertheless, its colossal size and exquisite carving entitle it to be regarded as one of the most remarkable objects of the kind extant.

Some curious sculptures are to be seen in China, on some of the singular stone bridges built in that country. The most remarkable of these is a stone bridge in the province of Fo-kien, which is three hundred and sixty perches long, and one and a half broad. It is of white stone, without any arches, and is supported by three hundred pillars, with a parapet on each side. The parapets are adorned with figures of lions at certain distances, and a variety of other curious sculptures. Another stone bridge of the same description exists at Fu-choo, the capital of Fo-kien, the parapets of which are adorned in a similar manner with figures of lions and other animals. This bridge is one hundred and fifty perches long, and consists of one hundred lofty arches.

The most beautiful, and perhaps the most wonderful marble structure which we shall have

to describe, is in India, and is to be seen at Agra, on the banks of the river Jumna. This is the Taj Mahal, erected in 1632 by the Great Mogul, Shah Jehan. It is supposed to be the finest piece of Saracenic architecture in the world, and stands on a river-terrace three thousand feet long. It cost seven hundred and fifty thousand pounds sterling, and twenty thousand men were engaged twenty-two years in its erection. Shah Jehan was himself imprisoned in it, and died, and was buried there, 1666. The best account that we have seen of it is contained in the following letter, written by an officer to his friend in England:

'I was the most delighted at Agra. If you have not seen the Taj Mahal there, it is worth while your coming from London to do so. It is of the finest white marble, with three domes and four minarets, finished with all the nicety of the ivory castles in a first-rate set of Chinese chess-men. On the tombs, within the chambers, are inlaid, mosaic fashion, the most beautiful flowers, formed of the most precious gems. In one anemone I counted above one hundred. The flowers and leaves are most exquisitely shaded. There is another noble chamber below this, and quite as beautifully inlaid, in which the bodies are placed in tombs fully as magnificent as those above. The light here is dim; the descent is by a flight of marble stairs. . . . The whole is raised on a platform of white marble, in the centre of a garden with fountains and *jets-d'eau*, sparkling through trees and flowers of all kinds, such as lofty and ancient cypresses, weeping willows, myrtles twenty feet high, geraniums, roses, and trees with blossoms equally lovely and sweet; contrasted with the date, cocoa-nut, and areca trees.'

Turning to curiosities in wood, we will first notice a remarkable bridge almost entirely built of *sandal-wood*, although we cannot ascertain any particulars about the style of its carvings. This bridge is at Paredenia, in Ceylon, and consists of a single arch of two hundred and twenty-five feet span, or half as wide again as those of London Bridge. We are not informed of the date of its erection, but it was certainly built before the present century.

The pastoral-staff presented to the Bishop of Hereford by the clergy and laity of his diocese, is an elaborate piece of carving. The wood employed is a piece of oak which once formed one of the pillars of the episcopal residence, and which, again, is said to have formed a part of a tree that was in vigour long before the Norman Conquest. The staff is profusely embellished with silver and gold enamel-work and with precious stones.

Of carvings in ivory, a very beautiful set has been presented by their Royal Highnesses Prince Leopold and the Princess Beatrice to the Brighton Hospital for Sick Children. The objects are both beautiful and valuable, and have been pronounced by competent judges to be exquisite specimens of native art. They are six in number, and the most prominent of them is an elephant with a state howdah, canopy, and figures exquisitely carved from a single piece of ivory. The work of the drapery and the tracery of the canopy is something marvellous in taste and execution. Another group consists of a kind of state barge, containing

twelve rowers, with paddles, and six figures on the deck. A third group is composed of a number of Indian idols, seated in state, and intended to illustrate heathen mythology. The other groups consist of a state car, and a bullock-wagon with attendants. The whole form a series of valuable and curious works of art.

Chinese ivory balls are well known. They are carved in delicately fine open work, nine balls one within another, each distinct, and every one but the innermost one, which is a mere ivory ball, carved in a delicate open-work pattern like the outer balls. As each sphere is separate, portions of the whole nine can be seen at once. Some years ago, Chinese balls were in such demand, that British artists set to work to discover the mode of manufacturing them; and in a short time they succeeded in producing work equal to that of the Celestials. We have seen a Chinese ivory lantern, about a foot square, also carved out of one piece, and with fanciful pendent ornaments at the four upper corners, and a fanciful top. The four sides, where glass would be, were scraped so thin as to be semi-transparent.

Two curious ivory carvings have lately been sold in London for a mere trifle. The first was an ivory tankard, a fragment only of which remained, shewing some beautiful carvings of figures of saints. The second was an old English watch, carved in ivory, with an enamelled portrait of Queen Anne.

The 'Horn of Lahel,' which belonged to the famous chief Lahel, in Hungary, is a curious relic. It is curiously carved in the style of the ninth century, and is in the possession of Count Raday, a Hungarian nobleman, who wore it at the coronation of the Emperor Francis Joseph of Austria as king of Hungary, June 1867.

A very fine carving in aqua-marine, or beryl, was shewn at the Paris Exhibition. This was a bust of the late Emperor Napoleon III. standing on an ornate pedestal, wrought in silver and red jasper, enriched with precious stones, and supported by figures in crystal and silver, representing Peace and War.

In miniatures ranked prominently the famous Cherry-stone, which once formed the greatest attraction of the Carpentier Museum, and sold for two thousand pounds at the Hôtel Drouot, in Paris. Upon the surface of this tiny object was carved in bold relief a cavalry charge in the time of ancient Rome. With the aid of the microscope might be distinctly seen, not only the manoeuvres of the combatants, but even the Roman eagles and the S.P.Q.R. were clearly traced. The initials of the workman, 'F. R.', have given rise to more than one controversy as to the origin of the work. The cherry-stone had been highly prized as one of the gems of the Villardi Collection at Milan, but was unfortunately destroyed during the Franco-Prussian War.

A valuable Roman gem was some time ago shewn in the Wroxeter Museum at Shrewsbury. This marvellous gem was a small red carnelian, about three-fourths of an inch in length, and of an oval form. The design, which was deeply engraved on it, represented a goblet, on each side of which stood a bird, while from each of their bills a stream flowed into the cup. This gem had lately been found amongst the ruins of the ancient Uriconium; but was subsequently stolen. A singu-

larly carved hollow bone was found at the same time, which was supposed to be a charm.

The writer once possessed a nut in two halves, in one half of which, fashioned in spun-glass, was an elephant with a howdah, and a man seated in it; the other half, with cotton, closed it in. In a similar nut were two dogs in spun-glass, in the attitude of running, which the second half of the nut shut in.

The following specimens of miniature work were exhibited by an artist at Cologne in 1812. In half a nut: a lady's dressing-case of thirty-six articles, amongst which were a pair of scissors, and a knife with two blades which opened and shut perfectly. In a nut: a cage containing a canary-bird, which opened its beak, fluttered its wings, and perfectly imitated the song of that bird. In the kernel of an almond: a Dutch windmill for sawing wood; at each representation the mill actually sawed a bit of wood. In an egg-shell: an apartment magnificently carpeted, in which a lady opened a piano and played two airs; in the back part was a marble chimney-piece, with a clock upon it of bronze, representing Napoleon on horseback. In a walnut: an elegant coffee-house with all belonging to it. A lady is at the buffet; and two ladies playing a game of billiards. In a mussel-shell: a gastronome sat before a table, and seemed to eat with great appetite the bits for which he opened his mouth each time. And lastly, in an egg: an automaton, who answered in writing any questions asked him, traced drawings, added up any numbers proposed to him almost as quickly as asked, and presented the total.

All these things were in gold, silver, steel, and brass, and are, like many other 'curiosities,' examples of patient though misplaced ingenuity.

#### FOR LIFE OR DEATH.

'You'll not do it, and get in, young chap, with hair on your head, I tell you that; and, mark ye, Britisher, 'tis no town-bred greenhorn who says it, but old Joe Burton, that has fought Injuns and hunted bufler on the Plains afore you left your mother's side, I calculate. 'Tain't to be done.'

'But, colonel'— I put in, smiling, yet not quite so much at my ease as I desired to appear; for this tough old frontiers-man, who remembered the foundation of the settlement, was no light authority as to the practicability of such an enterprise as that which I had, perhaps, rashly, undertaken.

'A clear throwing away of life, that's all,' gruffly rejoined the veteran, as he stooped to pat the hound that jumped up, whimpering, to receive his master's caress. 'He that rides the line to the head-waters of the Gila now has only to thank his own folly if his scalp dries in some pesky wigwam on the prairie. But there; I'm wasting words. A wilful lad, like a half-broke mustang, ain't easy to hold back. Anyway, Master Harry Lyndham, I wish you well out of the ugly scrape you have got into.'

Colonel Burton was by no means the only friend who strove to dissuade me from my project, but my word was pledged, my mind made up, and it only remained to complete the preparations for my hurried and perilous journey. This was how matters stood with me. I, Harry Lyndham, one of the many young Englishmen whom the hopes

of growing rich had drawn to the Far West of America, was then a resident of Tucson City, and a clerk in the employment of Curtis Brothers. The firm consisted of two old, and somewhat eccentric men—old-bachelor brothers—self-educated, as well as, in the commercial sense of the word, self-made, and whose names were known and respected through all that wild region that comprises Arizona, Montana, and the northern counties of Texas.

Oddly enough, it was because I was an Oxford man that my then employers had given me the preference over a score of candidates, for, in truth, there was nothing that old John and James Curtis so much prized as the learning which they had never had leisure or opportunity to acquire; nor had they had occasion to repent of their choice, since I had served them zealously enough, during the past year, to have gained a high place in their esteem; while I liked them well, since their hearts were as warm as their manners were quaint. Mine were no sedentary duties, and I was more often in the saddle than at a desk; for Messrs Curtis were speculators and general jobbers, dealing in maize, and wine, and hides, in tobacco, quicksilver, gunpowder, and 'notions'; and, above all, in cattle, the great staple of the far south-west.

It was not for hire alone that I toiled as I did, earning in Tucson—where immigrants from the Old Country are seldom held of much account when compared with the bustling, pushing Yankee—the reputation of a model clerk, as clerks are understood in that out-of-the-way nook of earth. My great stimulus was that I was in love with pretty, charming Rosamond Gray, the daughter of old Mr Gray, the banker at Cristobal, a town lying to the eastward of the Mimbres, and famous as a market for the agricultural produce of the vast districts bordering on Mexico. In one sense I was happy, for my love was returned; but in another I had met with what was almost a repulse, since Mr and Mrs Gray, although entertaining no personal objection to me as a son-in-law, were unwilling to bestow their daughter on any but a wealthy suitor.

'Get rich, Mr Lyndham,' the banker had said good-naturedly, 'and I see no reason why Rosamond and you should not be happy according to your own fancy. But neither her mother nor I can sanction an unconditional engagement.'

I was in hopes that I might take Mr Gray's advice, and by growing rich, or at least by acquiring a competence, win Rosamond's hand, the prize that I valued above all earthly considerations; and such is the rapidity with which, in those argentiferous regions, fortunes are sometimes amassed, that I was not without warrant for aspirations which in Europe would perhaps have seemed futile.

And now to explain the present position of the firm, and the reasons for my undertaking a journey fraught, according to the rugged old militia colonel's dictum, with almost certain disaster. Curtis Brothers, who, by a long course of judicious operations, had raised themselves from poverty to affluence, had at that time on hand a speculation of unusual importance. They had made, chiefly in Texas, very large purchases of horned cattle, sheep, and swine, destined to feed the swarming population of the sterile mining dis-

tricts, where provisions, and meat in especial, command high prices. The investment seemed the more likely to be profitable, since the twin plagues of New Mexico, drought and locusts, had occasioned a notable mortality among the cattle of Arizona and the adjoining territories, and great pecuniary returns were anticipated.

All these calculations seemed likely to be upset by the sudden outbreak of that smouldering Indian war which never quite comes to an end in that dangerous region. The Apaches, the irreclaimable foes of all white men, were on the war-path, leagued, as was reported, with sundry other tribes, the Kiowas, the Navajoes, and the dreaded Comanches; and already hideous tales of Indian cruelty and massacre reached us from many a lonely homestead within reach of the spoiler. The troops had been hastily withdrawn; the caravans about to traverse the prairie had halted for lack of an escort; and it was thought rash to venture more than a few miles beyond the cultivated country. Yet the day was at hand when the great herds of oxen and droves of swine, already purchased, would be waiting at Cristobal for the completion of the bargain, and my employers were well aware that unless the cattle could be paid for in hard dollars, a fatal blow would be dealt to the credit of the firm. Messrs Curtis had strained every nerve to collect the ready-money necessary, and the funds were forthcoming, but the entire scheme bade fair to be frustrated by the abrupt closing of the route, consequent on the war. No man, or party of armed men, could have been bribed to attempt the conveyance of the cash across the Plains, now haunted by the savage enemy, when I astonished my employers by volunteering to be the messenger.

'You shall not have to repent it, Harry, my boy!' said the elder of the two brothers, as he wrung my hand in his own horny one; 'you've stood manfully by us at this pinch, and we'd be mean enough for niggers to trample on if we didn't shew gratitude a little more substantially than by a few fair words. We never yet did raise a clerk to be a partner, but— There, there, Lyndham; I did not intend to egg you on by an offer, as if you needed that,' hastily added the honest old fellow, fearing, as he saw the colour rise to my face, that I had taken umbrage at his rough speech. 'Come safe back to us, lad, and all will be right.'

Mr James Curtis spoke words to much the same effect, at the same time bidding me be careful, and indeed it was curious to watch the struggle in my employers' minds between their natural eagerness to escape a financial wreck that almost amounted to ruin, and the kindly apprehension lest I should lose my life in their service.

As for myself, I knew well enough how great was the risk I ran, and for how momentous a stake I was about to play, and had not the goal before my mental vision been the bright prospect of calling Rosamond my wife, even the prospective partnership would hardly have tempted me to set off on an errand so perilous. As it was, I was resolved; and as I got ready for the start, I tried quietly to weigh the chances for and against my safely reaching Cristobal. I had a fair knowledge of the country, which I had traversed on four or five occasions, and was no novice in camping out, or in the familiar incidents of prairie travel. I could ride well, too, and was better mounted than

most of the residents in that district, where horse-flesh is cheap and plentiful, having in my possession a splendid chestnut thoroughbred, originally brought from Kentucky by some United States officer, and which was celebrated for strength and speed. I was fond of Sunbeam, and he of me, for he was docile and intelligent as well as swift, and would follow me for miles as a dog follows his owner, or stand, when I bade him, with the reins hanging loose upon his glossy neck.

There was scanty time for leave-taking. It was deep in the afternoon when I started, a dozen or more of the younger citizens of Tucson riding with me for the first half-hour, and giving me a hearty cheer as we parted. More than one strong right hand trembled a little as it grasped mine in token of adieu, and there was an unwonted moisture glistening in the honest eyes of some of the kind-hearted young fellows as they wished me 'God speed and a safe return.' Well do I remember wheeling my steed on a little elevation in the rolling, flower-enamelled prairie, and waving my hat in answer to the waving of hats and handkerchiefs from the little knot of horsemen, not one of whom, I am sure, ever expected to see me again on this side of the grave. Then I rode on, and lost sight of the friendly band of well-wishers.

The heavy sultry heat seemed to enwrap the land like a mantle. There was not a breath to stir the drooping leaves of the few cotton-wood trees that I passed in the lower levels, and on the uplands the long rank grass was parched brown by the fierce sun, for it was long since rain had fallen. The shrill, sharp chirp of the prairie cricket, and the far-off barking of that curious animal, the prairie dog, alone broke a stillness that was absolutely oppressive. Some three hours after leaving Tucson I reined up beside the blue, bright waters of a creek, and slacking my horse's girths, I allowed him to drink freely, myself replenishing the metal canteen which was slung at my saddle-bow, for in that desert land another opportunity of appeasing thirst might not readily occur. And presently leaving the grassy prairie, we struck into a tract of country still more lonely and desolate, where the only sound was the thud of my horse's hoofs on the scorched and barren earth.

Far away, to the left, there glimmered against the sky something like a shining wall, imperfectly visible, but which I knew to be the serrated crests and mountain peaks of the Mimbres, the natural fastnesses where dwelt the barbarian tribes whose torch and tomahawk had laid waste many a happy home. Nor were mementoes of their hostility lacking, as I traversed the track—deeply seamed by wagon-wheels, and strewn with the bleached bones of mules and oxen—that did duty for a road. Eight or nine times there loomed before me a rude wooden cross, on which was coarsely painted, in letters of black or red, sometimes a name, more often mere initials, followed by the simple inscription, 'Killed by the Apaches.'

The sun went down, the dew glistened on the rank herbage and tufts of the wild sage, and a welcome breeze cooled the heated air, while the broad bright moon, like a silver shield, rose to shed her chastened light over the vast expanse of prairie. Onward I rode, until at length, in a sort of oasis, where water, and grass, and trees, were to be found, I selected my camping-place for the night. With dawn I was again in the

saddle, nor did any incident, during that day's journey or the next, vary the monotony of prairie travel. Water was met with, sparingly, indeed, and of poor quality, but the brackish and turbid draught at any rate sufficed to allay that tormenting thirst, which is the great terror of the solitary wayfarer on those burning plains. Wherever there was water, too, there was pasture for my horse; while, for my own sustenance, I was provided with a tiny store of wild bull beef, cut in strips and dried in the sun, in Mexican fashion, and with a bag of parched maize-cobs. These, with a flask of French brandy, a Spanish poncho, and ammunition for my carbine and revolver, made up all my equipment, save only my canteen with its tin cup, and the leathern saddle-bags wherein were stowed away the gold and greenbacks destined to redeem the credit of Curtis Brothers with their creditors at Cristobal. On the evening of the third day I halted in a well-watered dell near the head of a creek, and at a distance, as I computed, of one hundred and twenty miles from Tucson. Eighty miles more, at most, would carry me to Fort Webster; and once across the Gila, I should be safe, and could make certain of completing my journey to Cristobal. Hitherto, I had met with no living soul, friendly or hostile. More than once, I had fancied that on the verge of the dim horizon I had caught a glimpse of tall spears and feathered heads; and on one occasion I had beheld a distant cloud of dust arise from the bare brown surface of the desert; but this might as easily have been occasioned by the passage of a herd of bison or of wild horses, as of the Apaches or their allies. My spirits rose as I proceeded on my way, and I began to feel confident of success.

On that night, lying wrapped in my poncho, with my saddle for a pillow, and my weapons within reach, I dreamed I was at home again, in Old England, and a boy once more, for I saw my sisters' faces around me, and those of former friends and playmates long dispersed, when suddenly I was aroused by the shrill, eager neighing of my horse, tethered hard by, and, waking with a start, opened my eyes to encounter the fierce eyes glaring upon me from a hideous painted face, bending over mine, and so close as well-nigh to touch it. I felt an Indian's hot breath upon my cheek, as he stooped over me, while of his purpose there could be little doubt, for, as I could see by the dim light of the dying watchfire, he was freshly besmeared with war-paint, and one hand held a glittering knife. As I started up, and grasped the butt of the revolver lying beneath my head, the Indian's other hand clutched me by the wrist, while again my steed neighed shrilly, and as I propped myself on one knee I could see that Sunbeam was plunging and rearing violently, while two dark forms were gliding about the spot where the horse was fastened, apparently intent on unfastening the long lariat by which he was haltered to the ground.

There are confused recollections of which memory is never able afterwards wholly to unravel the tangled thread. I remember a brief, sharp struggle, during which I twice received a slight graze from the knife that the Apache carried, and then my right wrist was freed from the hand that grasped it, and the sharp crack of the pistol, as three shots were successively fired, broke the

stillness. Then, almost immediately, I heard the thud of galloping hoofs upon the crisp turf of the prairie, and saw two mounted men, whose fluttering blankets and plumed heads proclaimed their nationality, ride off into the darkness. At my feet lay my first assailant. His hand, when I lifted it, fell back to earth, and his grim features, bedaubed with streaks of yellow, white, and black, were stiffening fast in death. The two eagle's feathers fastened by a silver brooch to his long black hair denoted that he had been a chief or principal warrior, while the paint and tattooing proved him to belong to the great tribe of the Apaches.

My great source of anxiety now was, lest the two braves who had escaped should have comrades within reach, and I at once decided that to press on was my wisest policy. It was now the dark chill hour that precedes the dawn, but saddling Sunbeam, whom I found fretful and agitated, after his recent interview with the Red robbers, I resumed my journey. Up to this time I had spared my horse, but now, heavy as was the sickly heat, and long as were the hours to be spent in traversing the brown, desolate plain, without grass or water, I urged Sunbeam on, the shining peaks of the Mimbres becoming more and more distinctly visible as we sped upon our way. Poor Sunbeam shewed, for the first time, signs of distress when we halted beside a stream, the brackish waters of which seemed to burn the thirsty lips that craved for them; but we were now, as I computed, within three hours of the river Gila, beyond which was safety.

The sterile, stony desert which spread itself before me when, on the next morning, my jaded steed and I again set forth upon the track, was almost bare of verdure. The long drought, and the heat of the scorching sun, had withered every green blade, while pools and creeks which ought to have been full of sweet pure water, were now mere belts of shingle, or hollows paved with dried clay. I shared the last drops of the precious fluid I carried in my canteen, and the last of the bleached corn, with Sunbeam, and the good horse seemed as though he were grateful for, and understood the kindness, for he rubbed his velvet muzzle caressingly against my hand as I stroked his neck, no longer sleek and smooth as satin, for fatigue and privations had roughened his coat, and dimmed the fire of his eye. Suddenly, as I stood beside him, I looked back, and saw what made, for the moment, my very heart cease to beat, as if an icy touch had frozen the blood in my veins.

Spears, and plumed heads, and wild forms, whose shields and scarlet blankets or buffalo-ropes were distinctly to be seen, were crowded together at the top of a rising ground, coming on over the prairie at the easy, swinging gallop which a mustang can keep up for half a day. As I set my foot in the stirrup, and leaped into my saddle, the Indians, silent till then, set up their fearful war-whoop, and with yells and frantic gestures lashed on their steeds, and took up the pursuit with a fury that sufficiently indicated what would be my fate should I be overtaken. Then began a desperate contest—a race for life or death. Sunbeam answered gallantly to my call, and for the first four or five miles I saw little of the enemy; but on they came pitilessly, and soon seemed to gain

ground. Had it been on the first day of the journey, I could have laughed at my pursuers, but now the superiority of my noble horse, in stride and strength, was neutralised by the comparative freshness of the shaggy steeds on which the Apaches were mounted. I groaned as I felt Sunbeam flag beneath me, though I urged him on with voice and hand.

Miles upon miles of rolling prairie were traversed, my horse keeping the lead, and speeding on with courage unabated, but staggering as he went, and bearing heavily on the bit as we descended the frequent slopes. The Indians saw their advantage, and pressed on, making every effort to come up with me. One arrow slightly wounded my horse in the neck; a second brushed my cheek, making me feel as though a hot iron had been drawn across it. I bear the thin, blue scar to this day. But maddened with excitement I spurred Sunbeam on, shook off the pursuers for a while, and presently saw, gleaming before me, the waters of a swiftly flowing river, which could be no other than the Gila; while beyond it rose the stockaded walls of a lonely building—Fort Webster, doubtless.

'On, Sunbeam, on! One more effort, brave horse—one more, and we are safe!'

I patted my steed's reeking neck as I vociferated the words; and with a faint, friendly neigh, the gallant horse responded to my appeal, and still reeled onward. The river, bordered by tall trees and cane-brakes, was very near; I could hear its rush and ripple, when Sunbeam, dead beat, stumbled, fell on his knees, and sank slowly down. There was an arrow, unknown to me, sticking in his flank, and the noble brute had actually been bleeding to death as he carried his master, with unflinching spirit, over leagues of the weary prairie. For the moment I almost forgot my imminent peril, in grief for the loss of my brave companion; but little time was left for regrets, for already the ground shook beneath the thunder of hurrying horse-hoofs, as, with yells and outcries of barbarous triumph, the Indians came racing up behind.

Thirty yards before me lay the river, but it was too deep and rapid for a man readily to swim or wade, and though I was weary and worn, yet I could not bear to abandon life while a chance remained. My pistol was in my belt, but my carbine was strapped to the saddle of the dead horse, and so were the bags which held the money of Curtis Brothers, and these I snatched up, though I had scanty prospect of saving either property or life, so near were the ruthless foes. They were but six lances' length away from me as I plunged into the brushwood, intending to take shelter among the tall reeds of the bank, in the faint hope that the clamours of the Apaches might bring out the troops from the fort. To my great joy, however, on reaching the river-bank, I beheld, moored to the stem of a mimosa tree, a canoe, containing fishing-tackle, and probably belonging to the garrison; and leaping into it, I seized the paddles, and pushed off into the middle of the stream, just as four or five of the Indians, who had dismounted, came bursting through the bushes, knife and tomahawk in hand.

The river ran swiftly, and I was inexpert in the management of a canoe; but the Indians, fortunately, hesitated to take the river, no doubt on account of the vicinity of the fort, and although they pursued me with fierce shouts and volleys

of arrows, only one of the latter hit me, inflicting a slight wound on my left wrist; while the welcome sound of a cheer and the discharge of a rifle from the further bank told that the Indian war-whoop had attracted the notice of the soldiers, of whose weapons the Apaches stood in wholesome awe. I was soon among friendly faces, although, so exhausted was I with fatigue and emotion, that I fainted before reaching Fort Webster.

My story, thus hastily narrated, is nearly at an end. The kindness of the commanding officer at the fort enabled me to push on, so soon as rest and refreshment had somewhat restored my vigour; and I reached Cristobal without further hinderance or peril, and was in time to save the credit of the firm whose representative I was, and to allay the surly suspicions of the half-wild Mexican and Texan cattle-farmers, who were already beginning to chafe and murmur at the delay. The oxen and other live-stock, some weeks later, were sent, along with a wagon-train that travelled under a strong escort of the United States cavalry, to Tucson; and I should have availed myself of the opportunity to return, had not an attack of fever, brought on by anxiety and over-exertion, prostrated me for a time, although youth and a robust constitution enabled me to shake it off.

I was still very pale and weak, and was sitting listlessly among the magnolia bushes and coffee-shrubs in the garden of the little inn, when I saw Rosamond and Mrs Gray, whose kindness to me during my illness had been unremitting, approaching me with joyful looks.

'Can you bear good news, Harry?' asked the latter, smiling; and indeed the tidings were very good ones. My quaint, worthy old employers had been better than their word, having not merely taken me into partnership, in recompense for what I had done on their behalf, but also appointed me their resident agent at Cristobal, a far healthier and more pleasant place than Tucson, with a share in the profits of the firm that was only too liberal. I have every prospect of present competence and ultimate wealth, while my engagement to Rosamond Gray is very shortly to be brought to a happy conclusion; but in the midst of my new-found prosperity, a saddening recollection will sometimes obtrude itself, as I remember the faithful, dumb friend whose bones are whitening on the banks of the Gila.

#### OSTRICH-FARMING IN AFRICA.

WITHIN the last seven or eight years, an industry has sprung up at the Cape of Good Hope, which, on account of its novelty, and the important results it produces, is worthy of notice. It is that of keeping ostriches in a state of semi-domestication, for the sake of their feathers, which have latterly become more and more scarce, and consequently more valuable. From the Cape, the business of ostrich-farming has been introduced into South America, where, as we shewed in this *Journal* (in 1872), it is carried on with more or less success. But the best feathers are still those produced in the south of Africa.

Like many other important undertakings, ostrich-farming, if not actually the result of an accidental

discovery, at least received a great impetus from an apparently trifling circumstance. A few years ago, one of the native traders in ostrich feathers and eggs, having more eggs than he could conveniently carry, left four or five of them in a cupboard adjoining a bakehouse in some Algerian village: on his return, about two months afterwards, he was surprised to find the broken shells of his ostrich eggs and a corresponding number of young ostrich chicks. The birds were, of course, dead, from want of attention; but the fact was undeniable that the fresh eggs of two months ago had, under the influence of the high temperature, actually produced fully developed chickens. This circumstance came to the knowledge of an officer of the French army, M. Crépu, who immediately perceived the practical results that might ensue from a careful following up of the hint thus strangely given. He set to work to devise 'artificial incubators,' for the purpose of hatching ostrich eggs, while at the same time he procured some pairs of adult birds, with a view to rearing them in a state of semi-domestication.

It is needless here to enter into particulars of the difficulties M. Crépu had to encounter. Suffice it to say that, after many disappointments, he had the satisfaction of finding a live ostrich chick actually hatched in his apparatus; and thus his assiduous efforts were crowned with triumph. About fifty-three or fifty-four days is the full term of incubation, which may be slightly accelerated or retarded by a trifling change in the heat to which the eggs are subjected, although the smallest excess or want of heat beyond a certain limited range is fatal. But to such perfection have artificial incubators now been brought, that the whole 'sitting' of eggs may be hatched with more certainty than if left to the natural care of the parents.

The baby chick when it makes its *début* is about the size of a small common fowl, and begins to pick up food at once. The nature of the food suitable for both the brood and the adults was a principal difficulty in the first attempts at the artificial breeding of the ostrich; but a careful study of the habits of the birds in a wild state has resulted in the discovery of the best kind of diet suited for the welfare of their domesticated brethren. The principal food given to the young birds is lucerne and thistles, and tender herbs and grasses indigenous to the country. Old birds are fed on more matured shrubs and plants, the leaves of which they strip off with their beaks. They are also fed on Indian corn, known at the Cape as 'mealies.'

It will be interesting to note that when the full number of eggs has been laid, the old birds invariably place one or two of them *outside* the nest—the nest consisting naturally of a hollow scooped out of the sand by the action of the legs and wings of the birds. It has been found that these eggs are reserved as food for the chicks, which are often reared, in a natural state, miles away from a blade of grass or other food. As soon as

the chicks emerge from the shell, the parent ostrich breaks one of these eggs, and the yolk is eagerly eaten up by the young ones. They are, therefore, both herbivorous and carnivorous; but it is not necessary to gratify their appetite for flesh, as they thrive excellently on the herbs above mentioned. Of course, where food is supplied in abundance, this precaution on the part of the parent birds of providing meat for their offspring is not necessary, and each egg so left is therefore wasted. Considerable loss also occurs in the number of addled eggs, when they are left to be hatched by the parents. It is said that the ostrich is able to discover when an egg becomes addled, and that it immediately ejects it from the nest; thus shewing an amount of wisdom which has hardly been attributed to a bird which is popularly supposed to thrust its head into a bush, when being hunted, in the vain hope that, as it cannot see, it cannot be seen by, its pursuer.

These observations were first made in Algeria, but it is at the Cape that they have been turned to practical account, and a very perfect system of ostrich-farming has been established there. Different practices prevail at different establishments. The birds are allowed occasionally to sit; but the success which has attended the use of artificial contrivances is so great, that fewer losses occur by this means than under natural circumstances, and the use of incubators is becoming very general. The chicks produced are so healthy as to shew that they do not suffer from this mode of treatment.

The general arrangement of ostrich-farms is very similar in all cases. The *desiderata* are plenty of space, suitable soil—that is, sand and pasture with facilities for growing the proper food—conveniences for shelter, and water. A well-conducted 'farm' would require perhaps £3000 capital to begin in a small way. The industry at the Cape is barely eight years old, and much has to be learned by a beginner; loss and disappointment are frequently experienced at first; but the occupation is considered a very profitable one, and is certainly healthy and agreeable; yet nowhere are patience, sagacity, and perseverance more necessary than in the conduct of a good ostrich-farm.

A healthy bird of a week old is worth £10; at three months it will be worth £15; and at six months, £30 and more. Feathers may be plucked from the ostrich when a year old, and each year's crop will be worth about £7 per bird. At five years, the breeder begins to pair his birds, and each pair will yield from eighteen to twenty-four eggs in a season. It is necessary to keep the adult birds in separate paddocks, which are generally surrounded by wire-fencing. The ostrich is liable to sudden fits of jealousy. In such a case, frequent quarrels would ensue if the birds were all together in one inclosure, with the result, if not of black eyes, at least of damaged feathers, and perhaps broken legs, and even death to one of the combatants. The blow from the leg of the ostrich has been computed to be fully equal to the force developed by the kick of a colt seven months old.

But whatever be the exact force produced, it is very severe, sufficiently so to break a man's leg.

The ostrich, however, both male and female, is quite an exemplary parent, notwithstanding the popular rumour that, like the crocodile, it leaves its eggs in the sand, to be hatched simply by the action of solar heat. Father and mother take it in turn to sit on the eggs, and when the ostrich takes his female companions out for their evening promenade in the desert, one of them always remains by the nest. This fact is sufficient to induce many breeders to leave the eggs to be hatched in the natural way, and merely to devote their energies to the rearing of the young birds and the collection of the feathers.

These are operations which require very great care. Regular supplies of food—about two pounds a day to each adult—are necessary; shelter must be provided for the night, and to shield the birds from the violent storms which frequently burst over the southern part of Africa; and there must be supplies of sand or pebbles, which the birds swallow, as aids to digestion. Pepsine is unknown among those birds of the desert, and they introduce a quantity of hard substances into their gizzard, to assist them in grinding up their food; just as the dyspeptic featherless biped takes his morning bitters to help the secretion of the gastric juices. It is very amusing to watch the flock of young birds as the attendant enters to scatter their breakfast. The moment he appears with his load of 'green-meat,' the youngsters of the ostrich family trot up to the entrance, and caper and dance about in the most grotesque manner, and devour their food with evident relish. They are generally tame, and to a certain extent tractable; but as they grow old they sometimes evince a sourness of temper which is anything but encouraging to the formation of a near acquaintance with them.

As the feathers are picked they are sorted according to their quality and purity of colour. The pure whites from the wings are called 'bloods,' the next quality, 'prime whites'; 'firsts'; 'seconds'; and so on. The tail feathers are not so valuable, and the more irregular the markings of the coloured varieties, the less valuable are they. 'Bloods' will fetch from forty to fifty pounds sterling per pound-weight in the wholesale market; and from this price they range as low as five shillings per pound.

The quality of the feathers produced by tame ostriches is fully equal to the best collected from 'wild' birds, while the general average is much higher. Notwithstanding the increasing yield, prices are rising instead of falling; indeed, good ostrich feathers are now thrice as dear as they were fifteen years ago. But it is more than probable that as the production increases the price will eventually fall. Even with reduced prices, the profits would be sufficiently large to render ostrich-farming a very profitable undertaking, and, as each year will increase the experience of breeders, the difficulties will be gradually diminished, and losses more easily avoided. As it is, this strange industry—the domestication of the wild birds of the desert, once regarded as types of liberty and intractability—is at the same time one of the most interesting and most profitable of the African trader.

## GLENCAIRN,

A DRAMATIC STORY IN THREE ACTS.

### FIRST ACT.

ONE day in September 1869, two gentlemen came to the shop of Messrs Marshall and Sons, an old and much respected firm of goldsmiths and jewellers, Edinburgh. One of the two was a clergyman in Forfarshire, who was known to a member of the establishment. He introduced the person who was with him as Lord Glencairn. His lordship, he said to one of the partners, 'had a shooting near him in Forfarshire, and being desirous to make some purchases in their line, he thought he could not do better than recommend him.' The person so flatteringly introduced was an Englishman of gentlemanly appearance and deportment, and seemed to be under thirty years of age. He was of medium height, with small well-formed hands and feet, brown hair, slight whiskers, a well-developed forehead, with that kind of placidity of countenance and dreamy indifference which are considered to be marks of high breeding.

Here was altogether a promising customer for the splendid bijouterie which crowded the counters and shelves. His lordship, as was learnt, lived in good style at the country-house he had rented with the shootings; he was kind and charitable to the poor people in the neighbourhood; and as a sort of guarantee for his respectability, he had made a deposit of several thousands of pounds in a bank in Dundee, on which he could draw for ordinary expenditure. In the absence of other recommendations, to rent a country-house with shootings, and keep an account with a banker in the nearest town, are usually accepted as an unchallengeable passport to good society in Scotland. It is a cheap way of making character, not very nicely scrutinised. The jewellers referred to felt the force of so high a recommendation; but professionally aware that all is not gold that glitters, they sagaciously consulted a book of the Scottish peerage as to his lordship's pretensions. There they discovered,

what is generally known, that the title of the Earl of Glencairn had become dormant upon the decease, in 1796, of John, fifteenth earl, brother and successor of the Earl of Glencairn who was so pathetically eulogised and lamented by Burns—

The bridegroom may forget the bride  
Was made his wedded wife yestreen;  
The monarch may forget the crown  
That on his head an hour has been;  
The mother may forget the child  
That smiles so sweetly on her knee;  
But I'll remember thee, Glencairn,  
And a' that thou hast done for me!

But although the earldom was dormant, there were two claimants, and probably this gentleman was one of them—perhaps a trifle too eager in taking up the title before it was regularly assigned to him. Then, the highly respectable character of the clergyman who had introduced him forbade any idea that he could be an impostor. Other things justified a good opinion of his lordship. He had taken up his quarters at the Royal Hotel, the notes he wrote bore an earl's coronet prettily printed in red ink, over a monogram H. G. of the same colour. The monogram purported to signify Hamilton, Earl of Glencairn. And the signature of his lordship was simply H. Glencairn. More than all this; he was attended by a 'tiger,' a little footboy with top-boots, buckskin breeches, and wearing a cockade, indicative that his master bore a military commission under the Queen.

Who could stand out against all this proof of high life? From the time of the introduction until the latter part of January 1870, Glencairn was a frequent visitor and purchaser, all he bought being put down to account. He was by no means one of your eager purchasers. He declared himself a *connoisseur* in the jewellery laid before him, and was particular in giving directions regarding the articles manufactured for him. He even went the length of sketching the articles he desired, and such was his elegant plausibility and fastidiousness that no one could have imagined him to be aught but a gentleman of refined

tastes and habits. Evidently, he had received a first-rate education, while his language, manners, and general accomplishments were proof of his having moved in the highest society. His harangues were spotless, almost saintly. On one occasion, seeing a lad in the shop, son of one of the partners, he benevolently gave him some good advices regarding his conduct through life, especially recommending him to be diligent, truthful, and always to keep in mind that 'honesty is the best policy.'

As if to lull all suspicion to sleep, this accomplished simulator incidentally told a member of the firm that he had large estates in Northamptonshire, and also in Scotland and Ireland; that he had been left a ward in Chancery, with an immense property, which would soon be at his disposal, upon the termination of the proceedings, which were nearly concluded. He likewise spoke of being a cousin to the late Marquis of Hastings, that he was a relative of the Duke of Hamilton, and was quite an intimate friend of the Prince of Wales. Piling up his connection with great people, he on one occasion produced a package, addressed, 'Rt. Hon. II. Glencairn,' containing a Dresden dish, having on it a very fine miniature of a beautiful woman. This miniature, his lordship mentioned, was a picture of the mother of the Great Napoleon, and that the Emperor Napoleon III., hearing of it, had sent to him to be allowed to see it; a special messenger had accordingly been sent with it to Paris, to shew it to the Emperor, who was so much pleased with it that he offered for it the sum of ten thousand pounds, which was refused. If the jewellers pleased, they might put it, for a short time, in their show-window; which they did as an act of courtesy. One way and another, his lordship purchased articles to the amount of £300, 7s. 6d., not a penny of which he paid. Several other tradesmen in Edinburgh were similarly imposed on by his lordship; one of them having furnished him with the full equipments of a Highland dress. In a note to a well-known draper, bearing the earl's coronet, and signed 'H. Glencairn,' his lordship orders 'a dozen turn-down collars,' which were sent to him. His lordship might be congratulated on the knack of keeping himself neat at other people's expense.

This easy way of getting into debt came to an end. His lordship having gone away without clearing scores, the jewellers got a little uneasy. They wrote to the clergyman who had introduced him, for explicit information, and all the comfort they got was vague and unsatisfactory. They were told that, 'so far as my information goes, your customer is perfectly good.' That he had been informed, 'Lord Glencairn's English residence was Milbury Park, Northamptonshire, and that his income was forty or fifty thousand a year. He has estates in Ireland and Scotland also. The mystery about title has arisen from his being known until lately as the Hon. Mr Hamilton. I think that was his mother's name, and he inherited

the English estates, assuming her name; but his grandfather Cunningham left him a ward in Chancery, with property and money, on the condition of his taking up the title when he was twenty-eight. The term expires this year, and he is to take up the title in March or April, and, I suppose, assumes the name now, possession being nine points of the law.' In these and some other plausibilities, there was little assurance. It was disheartening to know that his lordship had exhausted his credit with the banker at Dundee. Scotch bank agents are not easily imposed on; being usually jealous of strangers of whom they are not thoroughly assured. The banker in question was not slow in noticing that the deposit made with him by his lordship had gradually sunk to nothing, and he politely but firmly declined to let the account be overdrawn. The drying up of resources in this quarter had doubtless sent his lordship adrift to exercise his wonderful accomplishments elsewhere. Shortly after his disappearance, 'tiger' and all, from Edinburgh, and when Marshall and Sons were gloomily meditating on their misadventure, they received a letter from a well-known diamond merchant in London, making confidential inquiries concerning 'Lord Glencairn of Auchenleish, Perthshire, who, it has been stated, is entitled to the earldom and estates, and takes possession of his title of Earl, &c. next March.' His lordship had contemplated a swoop upon diamonds, rough or polished, it was all one; and we learn that he actually succeeded in carrying off a quantity of brilliants.

When the diamond merchant's letter sounded the note of alarm, Mr Thomas Smith, one of the firm, went off to London, to see after matters. Immediately it was visible that his firm had been lured; but, like a resolute Scotsman, he did not give up the game. He learned that the so-called Lord Glencairn could possibly be seen at the office of a Mr P——, his solicitor. Thither he proceeded, his account of three hundred pounds odds in his pocket, determined to get a settlement somehow, if at all practicable. Curiously enough, P——, a shrewd man of business, had yielded to the blandishments of his lordship, and averred that he was a wealthy man, who was to enter upon his estates on the 25th of March. Smith, however, had grown sceptical on the point, although he observed, on looking round the room, that it contained several japanned tin boxes inscribed with the name in gold letters, 'Right Honourable Lord Glencairn.' The tin boxes might be full of deeds concerning heritable property; but Smith, as we say, having learned to be doubtful of appearances, insisted on seeing his lordship, with a view to a settlement of his account. He felt certain that his lordship was up-stairs, for he saw his hat, which was of a peculiar cut, on the table, and caught a glimpse of his lordship's 'tiger' hovering about the door. It was no use denying the fact, and Mr Smith was taken up-stairs by Mr P——, and ushered into a room very elegantly

furnished, and provided with a handsome book-case, while on the walls were maps of his lordship's extensive estates. Glencairn was sitting at a writing-table. What ensued at this memorable interview had better be told in Mr Smith's own words :

'He rose and received me very courteously, and expressed his pleasure at seeing me. He said that his solicitor had informed him of my visit, and that I was perfectly right to come and make inquiries, but that he left his matters entirely in the hands of his solicitor, who would make everything right with me. After some general conversation, I left the room, and went down to Mr P——'s room again, and I said to him : "His lordship has thrown me in contact with you to settle matters. What do you propose to do ?" He said that in the conversation which he had with his lordship up-stairs, his lordship had instructed him, if I pressed the matter, to give me back several things that were still lying in the office there, and to give me a cheque for the residue, which I could get cashed. At the same time, he said that, if we did that, it would be a very foolish thing for our own interests, as his lordship intended to make very extensive purchases in jewellery, to give away to various parties ; and that he had been very much satisfied with the way we had conducted ourselves. Mr P—— added, that if I thought it better not to offend his lordship, he was inclined to give me a guarantee that the debt would be paid to us on the 25th of March.' Mr Smith was contented with this latter proposal. He accepted Mr P——'s written guarantee, the terms of which he dictated.

With this promise to pay, Smith returned to Scotland ; but when the 25th of March came, no payment arrived. Now ensues a tremendous splutter. His lordship had strungly disappeared from London. P—— was frantic, for he had been imposed on to the extent of five thousand pounds ; and in his helplessness, despatched a clerk to Edinburgh to see if anything could be heard of his missing lordship. Not a vestige of him could be discovered. Glencairn had evaporated into empty space. Bad news this for Smith ; but he held the guarantee, and instantly he proceeded to London to bring it to a bearing. On presenting himself to the luckless P——, he found that gentleman in despair ; for, besides being 'taken in' to the extent of five thousand pounds by this specious personage, he had given him in cash down the sum of eight hundred pounds. How he, a skilled and respectable London solicitor, should have allowed himself to be so egregiously duped by an adventurer, passes our comprehension.

Let us picture this defrauded solicitor and his unwelcome visitor, Smith, sitting together dolefully in that business-room. There is a considerable dramatic interest in the scene. Mr Smith, as member of a venerable firm more than a hundred years old, does not want to be harsh, but he would like to get his money. In his hand he holds the guarantee, and hints as to

what should be done. P—— acknowledges he is liable, but he cannot pay. He humiliatingly mentions that Lord Glencairn had made presents to himself and his clerks of many of the articles fraudulently purchased from the firm represented by Mr Smith, and he will be glad if these articles are taken back, and the guarantee discharged. The articles produced might amount to nearly a half of the bill. To make the best of a bad bargain, Mr Smith agreed to the terms. He was partly moved to do so by the father of the solicitor, an aged man wearing a pair of gold spectacles, who implored him to act in a merciful spirit. 'Why,' was the response, 'these very spectacles you wear are part of the goods taken from us.' 'Take them, oh, take them,' replied the old gentleman, with tears in his eyes ; and so saying, he removed the gold spectacles from his nose, and handed them over to Smith, in assuagement of his demand. We do not remember anything more touching than this in Molière. There was a further diminution of the claim, by the manager of the bank in Dundee returning a gold chain and locket which Glencairn had presented to one of his clerks, and which, like many other articles, had been stolen from the shop of Marshall and Sons ; his lordship in the course of his visits having done a little stealing as well as swindling. On the whole, Smith thought he had got pretty well out of the untoward affair. The net loss to the firm was L.131, 12s. 2d. Before quitting London, Mr Smith paid a farewell visit to the solicitor's office, to discover if his lordship, at his unceremonious departure, had left the Highland dress which he had procured from a shopkeeping firm in Edinburgh. He fortunately found the dress in a tin box, which he brought away, and the dress was returned to the parties concerned. So much for dealing on credit with a pretentiously high-class customer. The clergyman, the original cause of the disaster, owned he had been mistaken in his recommendations. We should think he will be more cautious in future.

We now drop the curtain at the conclusion of the first act of this strange drama in real life.

W. C.

## THE FLAG OF DISTRESS.

### CHAPTER XXXIX.—SHARE AND SHARE ALIKE.

IN the *Condor's* fore-castle. It is her second night since leaving San Francisco, and the second watch is on duty ; the men of the first having come down from the deck. That on duty is Padilla's ; in it Gomez, Hernandez, Velarde, and the two sailors of nationality unknown. The off-watch consists of Striker, Davis, the Frenchman who is called La Crosse, with the Dutchman and Dane. All five are in the fore-peak, the chief-mate, as they suppose, having retired to his cabin.

They are waiting till those on the watch, not required for deck-duty, come below. All of these have had intimation they will be wanted in the

forecastle; a summons that to most of the second-watch seems mysterious. They obey it, notwithstanding; and after a time the two sailors come down—the nondescripts without name, one passing under the sobriquet of 'Old Tarry,' the other having had bestowed upon him the equally distinctive, but less honourable appellation of 'Slush.' Shortly after, the second-mate, Padilla, makes his appearance, along with him Velarde.

'Theer be two not yit among us,' says Striker. 'In coorse, one's at the wheel.'

'Yes; Gomez is there,' responds Padilla.

'Where be Hernandez?'

'I don't know. Likely, along with him.'

'Don't much matter,' puts in Davis. 'I darsay we can settle the thing without either. You begin, Jack, and tell Mr Padilla and the rest what we've been talking about.'

'Twon't take a very long time to tell it,' responds Striker. 'Theer be no great need for wastin' words. All I've got to say are, that the *swag* in this ship shud be eekilly divided.'

Padilla starts, Velarde doing the same. 'What do you mean?' asks the former, putting on an air of surprised innocence.

'I means what I've sayed—that the swag shud be eekilly divided.'

'And yet I don't understand you.'

'Yis, ye do. Come, master mate, 'taint no use shammin' ignorance—not wi' Jack Striker, 't all events. He be too old a bird to get cheated wi' chaff. If ye want to throw dust into my eyes, it must be o' the sort that's stowed aft in the cabin. Now, d' ye understan' me?'

Padilla looks grave, so does Velarde. Old Tarry and Slush shew no sign of feeling; both being already apprised of the demand Striker intended to make, and having given their promise to back it.

'Well,' says the second-mate, 'you appear to be talking of some gold-dust. And, I suppose, you know all about it?'

'That we do,' responds Striker.

'Well, what then?' asks Padilla.

'Only what I've sayed,' rejoins the Sydney Duck. 'If you weesh, I can say it over 'gain. That theer yellow grit shud be measured out to the crew o' this craft share an' share alike, even hands all roun' without respectin' o' persons. An', it shall be so devided—shell, an' must.'

'Yes!' endorses Davis, with like emphatic affirmation. 'It shall, and it must!'

'Pe gar, must it!' adds the Frenchman; followed in the same strain by Stronsen the Dane, and Van Houten the Dutchman, chorused by Tarry and Slush.

'It an't no use your stannin' out, masters,' continues Striker, addressing himself to Padilla and Velarde. 'Ye see the majority's again ye; an' in all cases o' the kind wheresomever I've seed 'em, the majority means the right.'

'Certainly it means that,' echo the others, all save Padilla and Velarde, who remain silent and scowling.

'Yis,' continues Striker, 'an theer be one who an't present among us, as oughter have his share too.'

'Whom are you speaking of?' demands Padilla.

'I needn't tell ye,' responds Striker. 'If I an't mistook, that's him comin' down, an' he can speak for hisself.'

At the words, a footstep is heard upon the fore-

castle stair. A pair of legs is seen descending; after them a body—the body of Harry Blew!

Padilla looks scared, Velarde the same. Both fancy their conspiracy discovered, their scheme blown; and that Striker with all that talk has been only misleading them. They are undeceived, on hearing what the mate has to say. Striker elicits it, by repeating the conversation that has passed.

Thus Harry Blew gives rejoinder: 'I'm with ye, shipmates, to the end, be that sweet or bitter. Striker talks straight, an' his seems the only fair way of settlin' the question. The majority must decide. There's two not here, an' they've got to be consulted. They're both at the wheel. Therefore, let's all go aft, an' talk the thing there. There's no fear for our bein' interrupted. The skipper's asleep, an' we've got the ship to ourselves.'

So saying, Blew leads up the ladder, the rest starting from their seats, and crowding after.

Once on deck, they cluster around the fore-hatch, and there stop; the first-mate having something to say before going aft. The second does not take part in this conference; but stealing past unseen, glides on towards the after-part of the ship. Soon the others proceed in the same direction in a straggled string, which again contracts into a knot as they reach the open quarter-deck, by the capstan, there again stopping. And there, the moonlight, falling full upon their faces, betrays the expression of men in mutiny; but mutiny unopposed. On the quarter-deck no one questions them. For the traitorous first-officer has spoken truly: the captain is asleep; they have the ship to themselves!

It is Gomez who is at the wheel, his 'trick' having commenced at the changing of watches. He is not alone, but with Hernandez beside him. Neither is yet aware of the strike that has taken place; though during the day they have heard some whisperings, and are half expecting trouble with their subordinates.

The theme which engages them is altogether different—beauty, not booty, being the subject of their discourse, which is carried on in a low tone. It is Hernandez who first introduces it, asking:

'About the girls? What are we to do with them after gettin' ashore?'

'Marry them, of course,' promptly answers the other. 'That's what I mean doing with the beautiful Doña Carmen. Don't you intend the same with Inez?'

'Of course; if I can.'

'Can! There need be no difficulty about it, *camarado*.'

'I hope not; though I think there will, and a good deal. There's certain to be some.'

'In what way?'

'Suppose they don't give their consent?'

'A fig for their consent! They must consent! Don't be lettin' that scare you. Whether they're agreeable or not, we'll have a marriage ceremony, or the form of one—all the same. I can fix that, or I'm much mistaken about the place we're going to, and the sort of men we shall meet. If the Padre Padierna be yet alive, he'll marry me to Carmen Montijo without asking *her* any questions, or, if he did, caring what her answers might be. And if he's under ground, I've got another string to my bow, in the young *cura*, Gonzaga,

who, in my time, had charge of souls in a *pueblito*, nearer the place where I hope we shall be able to make shore. And should neither of these my old acquaintances turn up, there are no end of others who will be willing to tie the knot that's to make you happy for life. I tell you, *hombre*, you're steering straight towards an earthly paradise; you'll find that in Santiago.'

'I hope it may be as you say.'

'You may rest sure of it. Once in the old Veraguana town, with these girls as our wives, and they no longer able to question our calling them so—we can enter society without fear of shewing our faces. And with this big *bonanza* at our backs, we may lead a luxurious life there, or go anywhere else it pleases us. As for returning to your dear California, as you call it, you won't care for that when you've become Benedict.'

'You've made up your mind, then, that we marry them?'

'Of course, I have, and for certain reasons; otherwise I shouldn't so much care, now that they're in our power, and we can dictate terms to them. You can do as you please respecting marriage, though you have the same motive as myself for changing your *señorita* into a *señora*.'

'What do you allude to?'

'You forget that both these damsels have large properties in Spain, as worthy friend Martinez made me aware not long since. The Doña Carmen will inherit handsomely at her father's death, which is much the same as saying now. I don't refer to his gold, but the landed property he has elsewhere—in Biscay, which, please the Fates, I shall some day look up and take possession of. While the Doña Inez has no end of acres in Andalusia, besides whole streets of fine houses in Cadiz. To get all that, these girls must be our wives; otherwise, we should have no claim to it, nor be able to shew our faces in the Peninsula.'

'I've known all along about the Andalusian estates. The old usurer told me too—said he'd advance money on them, if he were sure of my marrying the lady. But, if you believe me, it's not altogether the money that's moving me in this whole affair. I'm madly fond of the girl—so fond, that if she hadn't a *chico* in the world I would become her husband.'

'Say, rather, her master; as I intend to be of Carmen Montijo. Once we get ashore, I'll teach her submission. The haughty dame will learn what it is to be a wife. And if not an obedient one, then, por Dios! she shall have a divorce, after I've squeezed out of her that Biscayan estate. Then she can go free, if it so please her. *Mira!* what's up yonder?'

The interrogatory comes from his observing a group of men assembled on the fore-deck, alongside the hatch. The sky cloudless, with a full moon overhead, shews it to be composed of nearly, if not all the crew. The light also displays them in earnest gesticulation; while their voices, borne aft, tell of some subject seriously debated.

What can it be? The men of the first watch, long since relieved, should be asleep in their bunks. Why are they now on deck? This, of itself, surprises the two at the wheel. And while engaged in mutual interrogation, they perceive the second-mate coming aft—as also, that he makes approach in a hurried, yet stealthy manner.

'What's up?' asks Gomez.

'Trouble,' answers Padilla. 'A mutiny among the men we engaged to assist us.'

'On what grounds?'

'They've got to know all about the gold-dust—even the exact quantity there is of it.'

'Indeed! And what's their demand?'

'That we shall share it with them. They say they'll have it so.'

'The dence they do!'

'The old *ladron*, Striker, began it. But what will astonish you still more; the first-mate knows all our plans, and's agreed to go in along with us. He's at the head of the mutineers, and insisting on the same thing. They swear if we don't divide equally, the strongest will take what they can. I've stolen aft, to ask you what we'd best do.'

'They're determined, are they?'

'To the death—they say so.'

'In that case,' mutters Gomez, after a moment or two spent in reflection, 'I suppose we'll have to yield to their demands. I see no help for it. Go back, Padilla, and say something to pacify them. *Maldita!* this is an unexpected difficulty—ugly as sin.'

Padilla is about to return to his discontented shipmates on the forward deck; but is saved the journey, seeing them come aft. Nor do they hesitate to invade the sacred precincts of the quarter; for they have no fear of being forbidden. Soon they mount up to the poop-deck, and cluster around the wheel; the whole *Condor's* crew now present—mates as men—all save the captain and cook. And all take part in the colloquy that succeeds, either by speech or gestures.

The debate is short, and the question in dispute soon decided. Harry Blew, backed by the ex-convicts, talks with determination—confirming it by emphatic exclamations. The others, with interests identical, stand by the two chief speakers, backing them up with words and cries of encouragement.

'Shipmates!' says the first-officer, 'this gold we're all after should be equally partitioned between us.'

'Must be,' adds Striker, with an oath. 'Share an' share alike. It's the only fair way. An' the only one we'll gie in to.'

'Stick to that, Striker!' cries Davis; 'we'll stand by ye.'

'Pe gar! certainement,' endorses the Frenchman. 'Vat for no? Sacré bleu! ve vill. I am for les droits de matelot—le vrai démocratique. Vive le fair play!'

Dane and Dutchman, with Tarry and Slush, speak in the same strain. The scene is short, as violent. The Spaniards perceiving themselves in a minority, and a position that threatens unpleasant consequences, give way, and consent to an equal distribution of the anticipated spoil. After which, the men belonging to the off-watch retire to the fore-castle, and there betake themselves to their bunks; while the others scatter about the ship.

Gil Gomez remains at the wheel, his 'trick' not yet being over; Hernandez beside him. For a time, the two are silent, their brows shadowed with gloom. It is not pleasant to lose some fifty thousand dollars apiece; and this they have as good as lost within the last ten minutes. Still there is a reflection to soothe them—they can think of other bright skies ahead.

Gomez first returning to speak of them, says :  
 'Never mind, *amigo*. There will be money enough to serve our present purposes all the same. And for the future, we can both build on a good sure foundation.'

'On what?'

'On our "Castles in Spain!"'

#### CHAPTER XL.—'LAND HO!'

The voyage Carmen Montijo and Inez Alvarez are now making is not their first. Both have been at sea before—in the passage out from Spain. But in Carmen's case, that was long years ago; while Inez's absence from it has been too short to exempt her from the *mal-de-mer*, and both of them alike suffer from it. Stricken down by it, they are for several days confined to the cabin, most of the time to their state-room.

In their affliction, they have not been so badly attended. The old negro cook, acting also as steward, comes up to the occasion; for he has a tender heart under his rough sable skin, and waits upon them with delicate assiduity. And Captain Lantanas is equally assiduous in his attentions, placing most of his time at their disposal. In due course they recover; and after a day or two waiting for fine weather, venture upon deck.

During their sojourn below, they have had no communication with any one, save Don Gregorio—who has been like themselves, invalided—of course also the captain and cook. But not any of the officers or sailors of the ship. Indeed, on these they have never set eyes, excepting on that day when they sailed out through the Golden Gate.

And now they wish to see Harry Blew and speak with him, but cannot. Whatever the reason, they have been a long time upon deck without finding an opportunity to communicate with him; and they wait for it with irksome impatience. At length, however, it seems to have arrived. He is in the waist with several of the sailors around him, occupied about one of the boats there slung upon its davits. While regarding him and his movements they cannot avoid observing those beside him, nor help being struck by them. Not so much their movements, as their features, and the expression there exhibited. On no one of them is it pleasant, but on the contrary scowling and savage.

Just then, Harry, separating from the sailors, is seen coming aft. It is in obedience to a message which the black cook has brought up out of the cabin—an order from Captain Lantanas for his first-officer to meet him on the quarter-deck and assist him in 'taking the sun.' But the skipper himself has not yet come up, and on reaching the quarter, the ex-mau-o'-war's man, for the first time since he shipped on the Chilean craft, finds himself alone in the presence of the ladies. They salute him with an *empressment* which, to their surprise, is but coldly returned; only a slight bow, after which he appears to busy himself with the log-slate lying on the capstan-head. One closely scrutinising him, however, would see that this is pretence; for his eyes are not on the slate, but furtively turned towards the ship's waist, watching the men, from whom he has just parted, and who seem to have their eyes upon him.

The young ladies thus repulsed, almost rudely,

as they take it, make no further attempt to bring on a conversation; but forsaking their seats, retire down the companion-stairs, keeping on to their own state-room, there to talk over a disappointment that has given chagrin to both, but which neither can satisfactorily explain. The more they canvass the conduct of the Englishman, the stranger it seems to them; and the greater grows their chagrin. For now they feel almost sure that something must have happened; that same thing—whatever it be—which dictated those parting compliments so cold and unfeeling. They seem doubly so now, for now they have evidence that such was the sentiment—almost proof of it in the behaviour of Harry Blew. He must know the feelings of his patron—the preserver of his life—how they stood at their last parting, and from this he has taken his cue to act as he is doing. Only in such sense can the ladies account for his reticence—if not rudeness.

They are hurt by it, stung to the quick, and never again during that voyage do they attempt entering into conversation with the first-officer of the *Condor*; only on rare occasions shewing themselves on deck; as if they disliked looking upon him who too vividly reminds them of the treason of their lovers.

Can it be treason? And if so, why? They ask these questions with eyes bent upon their fingers—on rings encircling them—placed there by those they are thinking about. That of itself should be sufficient proof of their loyalty. Yet it is not, for love is above all things suspicious—however dotting, ever doubting. Even on this evidence of its reliability they no longer lean, and can scarce console themselves with the hope hitherto sustaining them. Further off than ever seems the realising of that sweet expectation founded upon two words still ringing in their ears: '*Hasta Cadiz!*'

And thus the time somewhat tediously passes, till they hear two other words of cheerful import: '*Land Ho!*'

The cry comes from one of the sailors stationed on the fore-topmast cross-trees of the *Condor*. Since sunrise a look-out has been kept as the hands could be spared. It is now near noon, and land has just been sighted.

Captain Lantanas is not quite certain of what land it is. He knows it as the Veraguan coast, but does not recognise the particular place. Noon coming on with an unclouded sky, enables him to catch the sun in its meridian altitude, and so make him sure of a good sight. And as the Chilean skipper is a skilled observer, having confidence in the observations he has made, the land sighted should be the island of Coiba, or an islet that covers it, called Hicaron. Both are off the coast of Veragua, westward from Panama Bay, and about a hundred miles from its mouth. Into this the *Condor* is seeking to make entrance.

Having ciphered out his noon reckoning, the skipper enters it in his log: 'Lat. 7° 20' N. Long. 82° 12' W. Wind W.S.W. Light breeze.' While penning these slight memoranda, little does he dream of what significance they may one day become. The night before, while taking an observation of the stars, could he have read them astrologically, he might have discovered many a chance against his ever making another entry in that log-book.

A wind west-sou'-west is favourable for entering the Bay of Panama. A ship steering around Cabo Mala, once she has weathered this much dreaded headland, will have it on her starboard quarter. But the *Condor*, coming down from north, gets it nearly abeam; and her captain perceiving he has run a little too much coastwise, cries out to the man at the wheel: 'Hard a-starboard! Put the helm down! Keep well off the land!' Saying this, he lights a cigarrito, for a minute or two amuses himself with his monkeys, always playful at meeting him; then, ascending to the poop-deck, he enters into conversation with company more refined—his lady-passengers.

The sight of *terra firma*, with the thought of soon setting foot on it, makes all joyous; and Captain Lantanas adds to their exhilaration by assuring them, that in less than twenty-four hours he will enter the Bay of Panama; and in twenty-four after, bring his barque alongside the wharf of that ancient port, so oft pillaged by *filibusters*.

After staying an hour or so on deck, indulging in cheerful conversation and pleasant anticipations, the tropic sun becoming too sultry for comfort, one and all retire to the cabin for shade, and to take *siesta*—the last being a habit of all Spanish-Americans. The Chilean skipper is also accustomed to have his afternoon nap. There is no need for his remaining longer on deck. He has determined his latitude, figured up his dead reckoning, and set the *Condor* on her course. Sailing on a sea without icebergs, or other dangerous obstructions, he can go to sleep without any anxiety on his mind. But before lying down, he summons the cook, and gives orders for a dinner, to be dressed in the very best style the ship's stores can furnish; this in celebration of the event of their having sighted land.

For a time, the *Condor's* decks appear deserted. No one seen, save the helmsman, at the wheel, and the second-mate standing by his side. The sailors not on duty have betaken themselves to the fore-castle, or are lolling in their bunks; while those of the working-watch—with no work to do—have sought shady quarters, to escape from the sun's heat, now excessive. For the wind has been gradually dying away, and is now so light that the vessel scarce makes steerage-way.

Odd, though, the direction in which the breeze is now striking her. It is upon the starboard quarter, instead of the beam, as it should be; and as Captain Lantanas left it on going below. Since then the wind has not shifted, even a single point. Therefore, the *Condor* must have changed her course! Beyond doubt has she done this, the man at the wheel having put the helm *up*, instead of *down*, causing her to draw closer to the land, in direct contradiction to the orders of her captain!

Is it ignorance on the steersman's part? No; it cannot be. Gil Gomez is at the helm, and, being a tolerable seaman, should know how to handle it. Besides, Padilla is standing by; and the second-mate, whatever his moral qualities, is quite equal to the 'conning' of a ship. He cannot fail to observe that the barque is running too much inshore. Why has he not obeyed the orders left by the captain?

The words passing between the two tell why.

'You know all about the coast in there?'

queries Padilla, pointing to land looming up on the port-side.

'Every inch of it; at least, sufficient to make sure of a place where we can put in. That headland rising the port-bow is Punta Marieta. We must stand well in, taking care not to round it before evening. If we did, and the breeze should blow off shore, which it will, we'd have trouble to make back. Therefore, we must hug close, and keep under shelter of the land. With this light wind, we won't make much way before nightfall. Then, in the darkness, when they're below at dinner, we can put about, and run along till we sight a likely landing-place.'

'So far as being looked after by Lantanas, we need have no fear. To-day the cabin-dinner is to be a grand spread. I overheard his orders to that effect. He intends making things pleasant for his passengers before parting with them. As a matter of course, he'll keep all night below—and get fuddled to boot, which may spare us some trouble. It looks like luck, doesn't it?'

'Not much matter about that,' rejoins Gomez; 'it'll have to end all the same. Only, as you say, the skipper below will make it a little easier, and save some unpleasantness in the way of blood-spilling. After dinner, the señoritas are sure to come on deck. They've done so every night, and I hope they won't make this one an exception. If Don Gregorio and the skipper stay below!—'

The dialogue is interrupted by the striking of bells, to summon the second dog-watch on duty. Soon as the change is effected, Harry Blew takes charge, Striker relieving Gomez at the wheel. Just at this instant, the head of Captain Lantanas shews above the coaming of the companion stair. Gomez, seeing him, darts back to the wheel, gives a strong pull at the spokes, Striker assisting him, so as to bring the barque's head up, and the wind upon her beam.

'Good heavens!' exclaims the skipper angrily, rushing up the companion stair, and out to the rail.

What sees he there to evoke such an exclamation? A high promontory, almost abutting against the bows of his ship! At a glance he identifies it as Punta Marieta, for he knows the headland well; but also knows it should not be on the bow, had his instructions to the steersman been attended to.

'*Que cosa?*' he cries in a bewildered way, rubbing his eyes, to make sure they are not deceiving him, then interrogating: 'What does this mean, sir? You've been keeping too close inshore—the very contrary to what I commanded. Helm down—hard!'

He at the wheel obeys, bringing the barque as close to the wind as she can bear. Then the skipper, turning angrily upon him, demands to know why his first instructions have not been carried out.

The ex-convict excuses himself, saying, that he has just commenced his 'trick,' and knows nothing of what has been done before. He is keeping the *Condor* on the same course she was in when he took her from the last steersman.

The puzzled skipper again rubs his eyes, and takes a fresh look at the coast-line. He is as much mystified as ever. Still the mistake may have been his own; and as he can perceive there will be no difficulty in yet clearing the point, his anger cools down.

Soon the *Condor*, hauled close to the wind, regains her lost weatherway, sufficient for the doubling of Punta Marieta; and before the last bells of the second dog-watch are sounded, she is in a fair course for rounding the cape. The difficulty has been removed by the wind veering suddenly round to the opposite point of the compass. For it is now near night, and the land-breeze has commenced blowing off shore. Well acquainted with the coast, and noticing the change of wind, Captain Lantanas knows all danger is past; and with the tranquillity of his temper restored, he goes back into his cabin to join his passengers at dinner, which is just in the act of being served.

### THE ROYAL BENGAL TIGER.

Most sportsmen, and all who are fond of adventurous recitals, are tolerably familiar with the larger members of the Indian wild animals. Dr Fayrer, therefore, appeals to many readers when he puts forth a little book on the Royal Tiger,\* a ferocious creature likely to come under the notice of the Prince of Wales in the course of his expedition; hence a dissertation on the subject appears at a favourable time. As Dr Fayrer's book contains a concise life-history of the animal, and many interesting facts are collected together in it, we shall make no further apology for introducing our readers to the tiger of Bengal, so fitly termed, from his size, strength, beauty, and ferocity, 'Royal' (*Tigris regalis*), a very 'king of cats.'

Most people possess a good general idea of the tiger, which has often been strengthened by seeing the animal in zoological gardens and the like. Were it not that the lion acquires a certain majestic dignity from the presence of a mane, the tiger would at once be acknowledged as the head of the feline family. As it is, in India at least, in strength, size, activity, and beauty, he is far superior to the lion, which is only found at present in the north-west, in Gujerat and Cutch, and is regarded by Dr Fayrer as the outlying and degenerate representative of his African kinsman. The peculiarly striped skin of the tiger, and the intensity of its bright rufous ground-hue, so exquisitely set off with white about the head, serve well enough as a superficial distinction; but its tremendous canine teeth, the immense development of muscles about its chin and head, and its massive fore-paws, as compared with the hind-feet, scientifically mark it off from other cats. In much of its anatomy, and especially in its habits, it is simply a huge cat, a monstrous and ferocious development of the sleek tabby that purs by the hearth in every English cottage. The sharp retractile claws, the stealthy tread, the vision adapted for activity either by day or by night, the acute senses of hearing and seeing which it possesses, while that of smelling is comparatively feeble—these points at once show the kinship; while its cruel nature, and the loud anatory growls which the traveller encamped in the jungles frequently hears during the night, as the tiger calls its mate, irresistibly remind him of the cat tormenting the wretched mouse that has fallen into its clutches, and afterwards serenading its brethren on the tiles in the darkness.

Being a shy, morose animal, the tiger is usually found roaming about by himself; but at certain seasons his mate is sure to be not far from him. His favourite food consists of the ordinary domestic cattle, which are mostly, in the plains of India, weak and undersized creatures. When he cannot find these, he contents himself with the different deer of India and wild hogs; occasionally preying on monkeys, pea-fowl, and even smaller animals. These are suddenly struck down, mostly during the night, seized by the throat, and dragged off into some secure spot in the neighbouring jungle, which is known as his 'kill.' Here he eats what his appetite requires at once, and then leaving the carcass, retires to a smooth, trampled-down lair hard by (just as a hare lies in its 'form'), returning after a period of sluggish repose to take another meal at the kill. This he repeats, says Dr Fayrer, for several days; until the odour arising from decomposition, and the flocks of kites, vultures, crows, and adjutant birds, wheeling over it, or sitting hard by in a gorged state, proclaim his position to all. Then he shifts his hunting-ground, especially if it be the rainy season; but if it be the summer heats, he does not move far from the patches of long grass which adjoin some pool or swamp, where he may bask in the shade during the day, and prow by night round some neighbouring village, in hopes of securing an ox. One who is well acquainted with the tiger's habits, however, informs us that except in the very hottest weather, when water is very scarce, a tiger will not remain by its kill for more than twelve hours. In North and Central India, his wont is to drag the victim to the nearest stream, remain all night devouring it, sleep through the next day, and in the following night betake himself to fresh quarters. He rarely travels less than fifteen miles, and often twice that distance during a night. The tiger will easily consume a full-sized three-year-old buffalo in the course of a night, leaving nothing beyond his horns and hoofs, for his powerful teeth grind up the bones. Dr Fayrer quotes a recent instance of the animal's power and ferocity: 'A tiger at a bound sprang from an elevation right among a herd of cattle, and in his spring struck down simultaneously a cow with each fore-foot. Both were disabled—one, he immediately killed, and began to devour, whilst the other wretched creature lay with its back broken by the tiger's terrible blow within a few feet, watching the fate of its companion.'

If hard pressed for food, the tigress will desert her young, and even eat them. As for the young tigers, they are far more destructive than the old, killing three or four cows at a time, for the mere pleasure of killing, when they first set up in life for themselves; whereas, an older tiger rarely kills more than one victim at a time, and this will last him for a period of two or three days, or even for a week. Buffaloes have an instinctive knowledge of the approach of a tiger, and exhibit rooted aversion to him, snorting and trampling up and down, and forming into circle to receive his attack on their horns. Their herdsman often takes refuge in the centre of this circle, and the tiger must content itself with a weak outlying animal, or retire altogether from such formidable antagonists.

Much difference of statement exists as to the size attained by tigers, partly owing to the fact, that

\* *The Royal Tiger of Bengal*. By J. Fayrer, M.D., F.Z.S. London: Churchill. 1875.

the skin when removed is apt to stretch. Thus, instances of tigers twelve feet, and even a few inches more, are on record. Dr Fayer estimates the length of tigers from the nose to the tip of the tail as ranging from nine to twelve feet, though he deems one of ten feet by this measurement a large specimen. In height at the shoulder, the animal usually stands three and a half to four feet. Jerdon, in his *Mammals of India*, says 'the average size of a full-grown male tiger is from nine to nine and a half feet in length; occasionally tigers are killed ten feet in length, and perhaps a few inches over; but the stories of tigers eleven or twelve feet in length, which are so often heard, certainly require confirmation.' A good sportsman told him the largest he had killed in the Dinagore district measured nine feet eight inches.

Most people have noticed the fondness of stags for rubbing their antlers against trees, and scholars will recall Virgil's account of the bull practising with his horns upon a tree before venturing on a combat with his rival; the tiger is similarly fond of scratching the bark of trees, perhaps in order to keep his terrible claws in serviceable condition. Favourite trees in the jungles are deeply scored by these weapons. The Indian fig is especially chosen for this purpose, and may often be found deeply and vertically scratched from the height of ten or twelve feet above the ground. We remember a favourite cat thus utterly defacing the nicely bound back of a quarto in a library shelf next the floor, so remarkably does this whetting habit run through the feline family.

In his magnificent work on the *Deadly Serpents (Thanatophidia) of India*, Dr Fayer caused some sensation by shewing that during the one year 1869, 6219 deaths from snake-bite occurred in the Bengal Presidency alone, amongst a population of something more than forty-eight millions of souls. He now horrifies us with accounts of the devastation caused by man-eating tigers, which occasionally cause villages, and even whole districts, to be deserted. In one instance in the Central Provinces a single tigress caused the desertion of thirteen villages, while two hundred and fifty square miles of country were thrown out of cultivation before the creature was shot. Another tigress in 1869 killed one hundred and twenty-seven people, and stopped a public road for many weeks, before it too succumbed to an English sportsman. In 1868 the magistrate of Godavery reported that part of the country overrun with tigers, no road safe, and that a tiger had recently charged a large body of villagers within a few hundred yards of the civil station. It is impossible to give accurate statistics for the whole of so vast a country as Hindustan, but Jerdon corroborates these statements by asserting that in the district east of Jubbulpore, in 1856 and previous years, on an average between two and three hundred villagers were killed annually. Tigers apparently develop into man-eaters when they are old and sluggish, and the teeth are somewhat decayed. Preferring human flesh, they find, when once the awe natural to wild animals at the presence of man is shaken off, that he offers an easy and tempting prey. In some districts they abound; while in others, as in Oude and Rohilkund, one is only heard of about every six years. The natives are extremely superstitious respecting tigers, and in many parts dread the wrath of the slain tiger's spirit almost more

than they feared the creature when alive. The small clavicles or shoulder-bones, which are deeply imbedded in muscle, are esteemed valuable charms; while every sportsman, or, indeed, every one who is familiar with tiger-skins, knows how difficult it is to save the tiger's claws. The whiskers too are immediately plucked out by the sportsman's servants, on the tiger being shot, before their master can come up, as they are deemed a valuable love-philter. Those who are most rigorously honest in all other respects cannot refrain from thus mutilating a skin. On the spot where a tiger has slain a human being, in the district round Mirzapore, the natives erect a curious conical mound of earth, which is ornamented with some coloured wash for a coating, a few flowers, and one or more singularly shaped pieces of pottery. It is considered sacrilege to touch these, and once a year the inhabitants of the neighbouring villages visit the memorials, and worship there.

The loss of life and property caused by tigers has aroused government to appoint an officer in the Madras presidency specially for the purpose of destroying them. In other parts, a reward of five rupees (ten shillings) is paid for a tiger's head, which stimulates the native shikarries to shoot them with spring-guns and arrows, or to trap and poison them. In Bengal Proper about twelve hundred tigers, of which about four per cent. are cubs, are killed annually; but by far the larger number of these fall to the rifles of European sportsmen. As tiger-hunting in our Indian dominions forms great part of the picturesqueness and attractiveness of life in that country to Englishmen, we will conclude by giving a few details of this exciting but dangerous sport.

When it is remembered that besides the loss of life of which we have spoken, Captain Rogers assesses the loss of property which the ravages of the Indian carnivora entail at ten million pounds annually, it must be considered fortunate that tiger-shooting presents so many charms to its votaries. The animal is reported also to be increasing throughout India, doubtless owing to the general disarming of the natives after the Mutiny; so that there is no fear lest its chase should soon die out. There are several modes of tiger-hunting popular in India. In Bengal, Central India, and the North-western Provinces, he is pursued into his native jungles by sportsmen mounted on elephants; or he is driven by the native beaters along defiles and woodland ways, where he is shot from platforms constructed in the trees which overhang the path he must take. In Madras, Bombay, and South India generally, where but few elephants are kept, the tiger is often hunted on foot; but it is in this kind of sport that the most serious and fatal accidents occur, no foresight or readiness with fire-arms being always able to stop a wounded tiger's rush.

In shooting tigers from elephants, it is important to be well mounted. A good elephant, well trained to the sport, will stand the tiger's charge, and even rush to meet him; then comes the rider's chance to shoot him in a fatal spot; else he often springs on the elephant and endeavours to reach its mahout (driver) or the sportsmen in the howdah. Accidents not unfrequently happen in the confusion which ensues, the elephant trumpeting and rushing about in pain and fear; while the occupants of the howdah are being lacerated by the tiger's claws, or

endangered by their friends' fire. Dr Fayrer gives an instance of a major, whose elephant, on being thus attacked and severely clawed, ran away, and dashed its howdah off under the boughs of the trees in its way. Both the major and the mahout, however, contrived to grasp and hang to an overhanging branch, on to which the native soon pulled himself, and was in safety. The major, not being so active, hung for a minute, and then dropped, as it unfortunately happened, on to the wounded tiger, which, though paralysed by a shot in the spine, and unable to move its hind-quarters, seized the major with its fore-paws, and wreaked its rage upon him by deeply lacerating one leg and biting the other still more severely. After spending some dreadful moments in the creature's clutches, the major was released by his companion coming up and killing the animal. Spite of his injuries and the amputation of one leg, the major was able to return to England, and still, we hope, lives to tell of his unpleasant experiences.

The more usual way of despatching tigers, however, in the North-western Provinces is to place a bait for the creature, and then, on discovering its position, to have it driven past platforms erected in trees, from which it can be shot. There is much excitement and not a little spice of danger in the sport, as a tiger has been known to leap into such a machán, or platform, though it was luckily untended at the time. A friend, learned in this mode of shooting, informs us that when a tiger is suspected to be in a district, a three-year-old buffalo is purchased and tethered securely in a path of the jungle. Any smaller bat would be taken by a leopard, while the tiger would decline a bigger buffalo. His lair is found by the natives next morning, where he reposes by his kill, having satiated his appetite. A council is held, and the sportsmen are placed in their macháns, which are constructed in the defile where it is intended to drive the tiger. Then a large assemblage of beaters surround him, and noisily drive him onwards. Occasionally he manages to slip through the line; but almost anything will turn him, unless he be old and cunning. A leaf, for instance, dropped from a tree into his path, will at once cause him to turn back. So he reaches the open ground before the macháns, and is at once fired upon from them. Often he fights, and dies there; but sometimes he escapes into the jungle; and it is a dangerous task to follow him. He is left till next day, when a herd of buffaloes is driven in. As they detest a tiger, they enter fully into the sport; and finding him wounded, speedily kill him with their horns; or if he be dead, prance round him and toss about their horns. But the vitality of a tiger is great, and we know of one which, after having thus been shot at from a machán, and having its fore-arm broken, yet escaped, travelled thirteen miles, and was killed the same evening.

We possess a tiger's skull which was shot in this manner. He had killed and devoured a buffalo which had been fastened up for him over-night, and had been detected next day by the kites hovering round the remains of the feast. Two macháns were erected near, in one of which the commissioner of the district was placed; into the other and larger one ascended a friend and his wife. A gun was soon fired from the commissioner's station;

but after much excitement it was found to have been the result of accident while he was arranging his rifles. Then commenced the beating, the shooting, playing of tom-toms, &c., which shewed that the hunters were driving the game. At this moment our friend made the unpleasant discovery, that a hillock hard by completely commanded his platform; should the tiger take it into his head to come that way, he might with ease spring into it. Fortunately, he soon appeared in the opposite direction, coming leisurely down the path, and was at once 'dropped dead in his tracks' by an explosive bullet hitting him full on his chest.

#### RECENT HISTORY OF THE PITCAIRN ISLANDERS.

A BRIEF notice of the Pitcairn Islanders in Dilke's *Greater Britain* reminds us that there are still in existence two remnants of the once famous mutineers of the *Bounty*—one in Pitcairn Island, in the vast South Seas; the other in Norfolk Island, in the Australian Seas. The readers of this *Journal* may perhaps remember the main incidents of this singularly interesting history, down to about the year 1850.\* We then recounted how Captain Bligh, in H.M.S. *Bounty*, set out on a voyage of discovery to the South Seas in 1787; that in 1789 many of his crew, headed by Lieutenant Christian, mutinied, forced him and eighteen of the crew into an open boat, and cast them adrift; that after much suffering he and some of his companions reached England in 1790; and that in 1791 the government sent off Captain Edwards in the *Pandora* to seek out the mutineers and bring them home for trial. There came to light facts, one by one, shewing how Lieutenant Christian and his companions, after much quarrelling and fighting, settled down, some at Otaheite (Tahiti), and some at Toobonai, with Otaheitan women as wives. Captain Edwards captured the party at Otaheite, but did not know that the others were at Toobonai. Christian navigated the *Bounty* to Pitcairn Island, burnt the ship, and settled down finally at that island. Happily, there was a steady religious man, John Adams, among them, and he, after Christian's death, trained up a rising generation of mixed breeds, in habits of peaceful industry. How these Pitcairners increased and multiplied to a community of a hundred and fifty souls—simple, well principled, and loyal to the English sovereign—and how they came to have interviews occasionally with visitors from the outer world, our two former articles shewed. Let us now briefly touch on the incidents of the last quarter of a century.

The year 1851 marked the beginning of a series of proceedings destined to make an important change in the condition of the islanders—more than sixty years after the mutiny. A plan was formed to remove them to another spot, under the dignified title of a colony, although small in dimensions. The Colonial Secretary in England, Sir John Pakington, wrote despatches on the subject; and so did his successor; but these ministers differed one from another concerning what it was best to do. Norfolk Island, near Australia, had for some time been

\* *Chambers's Journal*, January 5, 1850, 'The Pitcairn Islanders in 1849'—*ibid.*, April 13, 1850, 'Letters from the Pitcairn Islanders.'

used as a sort of prison or penal settlement for the more desperate among the convicts; it had not turned out satisfactorily; and the government conceived the idea of transferring the Pitcairners to that place as their future home. Accordingly, Sir William Denison, governor of New South Wales, took the subject into consideration, and decided that the removal might possibly be effected in 1854. The Pitcairners, now increased by the addition of grandchildren and great-grandchildren to a total of a hundred and seventy persons, expressed pleasure and thankfulness when they heard of the plan. The end was not yet, however; governments moved more slowly than the simple Pitcairners expected.

A pleasant picture of this deeply interesting people was presented in 1855, when Captain Fremantle, in H.M.S. *Junco*, touched at the island, to ascertain how far unity of opinion and wish prevailed among the islanders. The Rev. Mr Nobbs, their pastor and schoolmaster (a few 'outsiders' had reached them by this time), assembled them together, and read to them a description of Norfolk Island, and the terms of the Queen's offer. A large majority at once assented to the proposal; but some could not find heart to quit the only home they had ever known, albeit barely a mile in length. George Adams, a son of John Adams the mutineer, was among these. They were sensible of the Queen's kindness; they well knew that any further subdivision of the land of their tiny island would reduce the portion for each household or family to a mere patch scarcely worth cultivating; but still they were loath to leave 'home,' and make a perilous voyage over thousands of miles of ocean. At length, one hundred and fifty-three, out of a total of a hundred and eighty-seven souls, decided on Norfolk Island. Captain Fremantle found them to be so affectionately attached one to another, that he believed they would all join when the time of departure arrived. He described them as a pious, unsophisticated, single-minded, cheerful, docile people; his crew were never tired of rendering them little kindnesses, which the islanders returned in their own artless way. Whether at Pitcairn Island or Norfolk Island, they were delighted at the idea of being recognised subjects of Queen Victoria.

In 1856 Sir William Denison chartered the ship *Morayshire*, to convey the descendants of the mutineers to Norfolk Island. Lieutenant Gregorie, R.N., managed the enterprise. He arrived at Pitcairn on 22d April, and found that the islanders had provided themselves with good store of sheets and packing-cases, in readiness for the grand flitting. All, though some of them unwillingly, had decided to go. They packed up everything likely to be useful, with a stock of swine, fowls, and fresh vegetables; leaving a few head of live-stock to multiply as they might.

It was a scene without parallel when, on 3d May, the islanders departed from Pitcairn; without parallel, for though the number was small, no community had ever before been reared under such remarkable circumstances. Sixty-six years after the mutineers of the *Bounty* first landed on the island, their descendants quitted it. The simple-hearted people were troubled with some of the miseries of a long ocean-voyage; but they kept up cheerfully, the men and boys helping the

sailors in any way that might be useful, the women and girls engaging in needle-work and domestic duties. An infant was born during this remarkable voyage; and the little stranger received the names of Reuben Denison Christian. (The little community had only a dim knowledge of the fact, that Lieutenant Christian, grandfather or great-grandfather of this child, had been a lawless mutineer.) They only sighted one island during the voyage; it caused great excitement among the Pitcairners, being the first strange land the greater part of them had ever beheld. With the crew they were on excellent terms throughout, and harmony was never once disturbed.

After a voyage extending over sixty-three degrees of longitude, the *Morayshire* arrived at its place of destination. What the Pitcairners felt at such an exciting time, we can hardly conceive in our present English mode of life: hopes, fears, wonderment, regrets followed in rapid succession, as the shores of Norfolk Island came into view; and the people speculated whether Queen Victoria thought of them as anxiously as they thought of her. One hundred and ninety-four (including the 'little stranger') landed on the 8th of June. The government had set aside such buildings and store-sheds as might be immediately needed, leaving the people to provide better at leisure. Dr Selwyn, bishop of New Zealand, paid them three or four friendly visits, taking such seeds and plants as might be useful to them; and Mrs Selwyn stopped with them many weeks, ingratiating herself with them by kindnesses which easily won their hearts. Norfolk Island, small as it is, was raised to the dignity of a distinct colony, but under the charge of the Governor-general of New South Wales. In October of the same year, Captain Fremantle paid them a visit in the *Junco*, and was pleased to find them progressing favourably. There were, however, many perplexities in the thoughts of the islanders. The long voyage and the change of scene had somewhat unsettled their habits. They marvelled at the contrast between the past and the present; at the vast size, as they deemed it, of the really small Norfolk Island; at the largeness of the buildings; and at the amount of property made over to them. They were like children, almost bewildered with a sense of magnitude in all around them; and displayed a kind of timid distrust of their own powers of appreciating what they saw.

In the following year, Sir William Denison went over to see how the little colony prospered. He found their simple code of laws inapplicable to their present position, and substituted a new code—a constitution, in fact. It almost excites a smile to hear of so formal an instrument as a constitution for a colony of only two hundred persons, with provisions relating to magistrates, councillors, doctors, chaplain, commissioners, a great seal, oaths of allegiance, public meetings, public works, public receipt and expenditure, judges, juries, legislation, punishments, fines, schools, and schoolmasters. There was a little dark spot, however; the people had become somewhat indolent and improvident. The government had provided them amply with live-stock, seeds, plants, tools, agricultural implements, boats, and fishing apparatus; and as their wants were simple and easily satisfied, the islanders felt no need for doing much work, nor 'saving for a rainy day.' He saw evidence that they would be benefited by the instructions

of a millwright and smith, a shoemaker, a mason and plasterer, and a gardener or farmer; and he planned the means for supplying these aids after a time. One great advantage was, that the moral conduct of the people remained as exemplary as ever; the lessons taught by old John Adams had sunk deep and taken firm root. The whole adult population assembled to meet Sir William; and he was struck with their general good looks. 'There were none who could be called strikingly handsome, but all had good features, well-developed foreheads, and an intelligent expression of countenance.' Mr Lower could have added a new chapter to his *History of Surnames*, by a study of those which prevailed among the islanders. A census of the population revealed the names of the original mutineers of the *Bounty* over and over again: Christian, Adams, Young, Quintal, and McCoy, were one or other of them in almost every house. There were two hundred and twelve souls altogether, forming thirty-four families. Only one bachelor, Samuel McCoy, lived by himself; and there was an old spinster of sixty-four, Mary Christian. One family comprised Charles and Charlotte Christian and eleven sons and daughters. Matrimony was evidently in high favour, for there were only seven spinsters of marriageable age.

By the year 1859, some of the older people began to have a yearning to return to their first home, Pitcairn Island; and two families, numbering seventeen persons, made the voyage in that year. The women generally shewed more of the qualities of their original Otaheitan mothers than of their English fathers, especially a passionate fondness for music and dancing; and were with some difficulty imbued with English notions of thrift, application, and mental exercise.

Another official visit, in 1862, led to the following report: 'On the whole, I am clearly of opinion that as large a measure of success has attended the removal of the Pitcairn Islanders to Norfolk Island as could well have been expected. The people are not much given to steady and continuous labour; but, on the other hand, it must be recollected that the climate indisposes to exertion, and they have not the stimulus of want to prompt them to toil. The people live in security and abundance, attend divine worship regularly, and are free from all those foul practices and baneful superstitions which render the occupants of too many of the lovely islands of the Pacific licentious.'

Occasional notices in later years shew that there is a little interfusion of new blood among them, by marriage with English persons from Australia and New Zealand. Some, moreover, have gone back to their own tiny island. When Sir C. W. Dilke was collecting materials for his *Greater Britain*, he made a brief stay at Pitcairn Island. The Union-jack was espied on shore; canoes pulled off to the ship, laden with oranges and bananas; three men nimbly came on board; and one of them, without any embarrassment in manner or speech, grasped the captain's hand, and said: 'How do you do, captain?'—'How's Victoria?' The Queen of the British Empire lived in their hearts, although they had never seen her. It appeared that fifty-two of the Pitcairners had found their way back from Norfolk Island, but that some difficulty had arisen about ownership of bits of land, the late comers interfering somewhat with the early comers. The handful of people traded occasionally with

passing ships, exchanging fruit and poultry for cloth and tobacco. Wine and spirits they knew nothing about. The old familiar names of Adams and Young were prevalent. Some lady-passengers in the ship sent a blue silk dress to a Mrs Adams, and a red-and-brown tartan to a Mrs Young. Young was also the name of the magistrate, a sort of small viceroy to represent the Queen. One of the most interesting points connected with the brief interview (none of the crew or passengers appear to have landed on the island) was, that the three islanders inquired earnestly for any recent English periodicals! Here was the old Saxon voice speaking out again, on a speck of land amid the vast ocean.

Thus it is, then. The mutineers of the *Bounty*, or such of them as escaped violent deaths, intermarried with Otaheitan women; and their descendants, morally pure to a most unusual extent, now inhabit two widely distant bits of land—Norfolk Island in the Australian Seas, and Pitcairn Island in the South Seas—both alike rejoicing to call themselves subjects of Queen Victoria.

#### SPREAD OF INFECTION.

OUR recent article on the 'Curiosities of Infection,' has been the means of bringing us a paper on the same subject, by a gentleman who has given much attention to the subject, and whose observations seem worthy of general perusal. His remarks are as follows:

The mysterious outbreak of scarlatina among the distinguished guests who attended a recent fashionable dinner-party in London, may produce some beneficial results, should it draw more general attention to the laws pertaining to the communication of this and kindred preventable diseases, and induce the medical profession to bestow more observation on one important matter, perhaps too much overlooked at present—namely, the discovery of the various periods of time that all convalescents from infectious and contagious diseases continue to carry about with them the seeds of these diseases, to sow them broadcast among their healthy but susceptible brothers and sisters.

Properly considered, the warnings of disease are beneficent in character, and if disregarded, we have only ourselves to blame. It is an important duty to trace out the laws that govern the transmission of infectious and contagious diseases, these being, perhaps, the most obscure and mysterious of any laws with which we are surrounded. If a solitary weed gets into a garden, it may reproduce a hundred that will replant themselves and grow in the surrounding soil, after the original plant has withered away; and, similarly, a disease may strike root in the human system, mature itself there, and leave the system to resume its normal condition. But, during this process, the original seed has multiplied itself considerably, and the system in which it has flourished resumes its pristine health, only after it has thrown off all these products. And if, while it is throwing them off, the convalescent is permitted to associate with his fellows, these seeds are certain to reproduce the same disease in those who may be

so unfortunate as to come into contact with them. This may be one of the laws regulating the propagation of scarlatina, typhus, and other 'pestilences that walk in darkness;' and the rational precaution of 'Outside the camp with them!' at once suggests itself.

A too common impression prevails that the danger of contagion from a scarlatina convalescent is ended in two or three weeks; and, consequently, children are sent back to school, or young women to milk cows or attend to dairies, after an isolation of about this length of time, though this is just when they are likely to be throwing off the seeds of the disease in their most dangerous and virulent form. Some have found, to their sorrow, that six and nine weeks are not too long to isolate scarlatina convalescents; and perhaps we would not do wrong to isolate all convalescents from scarlatina, typhus, &c. for three months; as it is much better, in such cases, where the health and lives of thousands are at stake, to err on the safe than on the unsafe side; and the cost of keeping a minimum of convalescents for three months would be a bagatelle, when compared with the happy immunity from contagion that would be secured to the public at large. It is the want of this simple precaution that is causing so many serious outbreaks of scarlatina in our public and national schools, resulting, in many cases, in the closing of the schools to stamp it out. How much easier would it be to isolate the original patient as soon as the disease appears, and continue this quarantine, when convalescence ensues, for three months, and by this means prevent the disease from ever assuming any alarming dimensions.

With these considerations before us, we may return to the outbreak of scarlatina at the dinner-party in London, and endeavour to ascertain what might be the most likely channel of communication. Suspicion was directed at first to the table-linen, cases being known or suspected where the germs of this disease have been transmitted through laundries from one family to another. But in this remarkable case, the table-linen, though first suspected, was exonerated from all blame, when it was noticed that one of those who had taken the disease had not been in the dining-room at all, but had taken tea with the company in the drawing-room. This at once brought the cream under suspicion; and upon investigation it was discovered that one of the maids engaged in the dairy from which the cream had been obtained, had recently had the disease. Now, milk or cream, as has been frequently proved, is a very common vehicle for the conveyance of contagious germs; it has so many opportunities, and such a capability, of absorbing them. Here, then, perhaps, may be the first link in the chain that carried scarlatina to nearly a score of guests at a dinner-table, all unconscious that the seeds of a serious disease were lurking in the cream-jug, waiting to be taken into their systems to lay them prostrate.

Cases are known where the germs of this disease have got into milk through the cows being milked by scarlatina convalescents, when the fine particles of the peeled skin are supposed to have fallen into the milk, thus polluting it with the contagious germs. In other cases, the wells from which the water had been taken to wash the bowls, &c. have been blamed; the theory being, that the discharges from patients had found their way into the wells, and in this roundabout way the dangerous germs had at length got into the milk.

There are still other ways in which these mysterious germs may find a lurking-place in milk. Dr Squire, Secretary of the Epidemiological Society of London, in a paper read before that Society, and published in *Public Health*, March 25, 1875, draws special attention to the imperceptible emanations that are given off by the lungs and pores of scarlatina convalescents; and, according to his opinion, these are more seriously contagious than the decomposed cuticle, that comes away during the process of desquamation. Taking this opinion into account, we can understand how liable milk and cream are to be the recipients of these contagious emanations. Any milk exposed, as already described, in open bowls, in the vicinity of a scarlatina convalescent, will be continually absorbing these emanations; and where it is the belief that all contagion has left convalescents in two to three weeks, and these are permitted to assist in, or look after, a dairy, the danger must be very seriously increased.

In many dairies, it is the practice to blow the cream off the surface of the milk with the mouth, and when we connect this filthy practice with Dr Squire's opinion that the lungs give off the most virulent of the contagious matter, it becomes clear that cream may absorb this in greater quantity, and in a concentrated state, and that, consequently, all scarlatina convalescents should be rigorously excluded from dairies, as well as from the milking of cows, for three months at the very least. We know a case where the attendant on some cows took scarlatina, and their owner forbade him from going near either the cows or the milk for nearly four months.

We have had to refer to wells. These are ascertained vehicles of contagion for several diseases—cholera, diarrhoea, scarlatina, typhoid fever, &c.; and though they have, in consequence, been generally condemned, and many shut up, it does not follow that this old means of obtaining a pure supply of water at small cost is past redemption. It is perhaps too much the practice to condemn a system because thoughtless or ignorant people have carried it out carelessly or improperly, and if recently constructed pumps and wells were all examined, it might be found that it is only since the introduction of the 'cheap and nasty' element into their construction, that they have become dangerous. As modern pump-wells are built, the joints of the stone or brick shaft are not cemented at all, though they ought to be, to make the whole perfectly bottle-tight, and insure that all surface

or polluted water, before finding its way into the well, has undergone the purifying process of percolation through the soil and gravel to the very bottom. Instead of this, the brick or stone work is built without mortar or cement; and, consequently, every joint becomes a drain to convey the surface-water, sewage, &c. into the well; and what was intended to be, and might be, a well of life-giving water, has, to save a few pounds, been transformed into a death-giving cesspool.

We had an opportunity of seeing one of these wells opened recently that had several cases of typhoid fever laid to its charge; and the verdict that had been given was, to take out the pump and close the well. This well was some twenty to thirty feet deep, built of stone, and every joint was gaping open. Through these openings the sewage from some neighbouring gutters, ash-pits, &c. was trickling and falling to the bottom, leaving a slimy discoloured track on the stones as it descended. When a drop of Condyl's Fluid was put into a glass of the water, it sank to the bottom, coloured like an emerald.

While inspecting this well, the idea occurred to us that this shaft might be utilised at a very small outlay, and a pump put into it qualified to give perfectly pure water, were a cast-iron pipe, perfectly water-tight, to be placed in it, and all the space between the pipe and the stone-work filled up with gravel, earth, and any good filtering material. The surface-water would all get freed from its organic impurities before it could reach the bottom of the pipe, and the water drawn up by the action of the pump would be quite safe for domestic and drinking purposes.

All that appears to be requisite for obtaining water free from surface pollution is to carry down an iron pipe (like the Abyssinian or American pump) to such a depth as will allow of proper filtration for the surface-water. Every pump of this description would have nature's own filter-bed in the soil and gravel surrounding it; and this system, enlarged, might be successfully employed for the water-supply of all our cities and towns situated upon, or near suitable rivers. One or several large iron pipes (according to the supply required) could be sunk in the soil and gravel near the margin of the river, care being taken to select a spot where the gravel was deep, and had an underground, uninterrupted, and deep layer of gravel, connecting it with the bed of the river. In this place the pipes could be screwed down as far as might be found necessary to obtain a plentiful supply of water. This will usually be found after a certain depth below the river-bed has been attained. When a depth sufficient to obtain the supply has been reached, all that remains is to apply pumping apparatus to the top of the pipe, and a constant stream of pure water, filtered by the river's own bed of gravel, &c. is the result. To save cost, a small pump, say one or two inches in the bore—on the American or Abyssinian system—might be used as a 'prospector' of the ground, and when the best site had been discovered, the work could proceed on the larger scale.

If a pure and plentiful supply of water, on the large or small scale, could be procured in this way, all surface drainage and sewage pollutions would be avoided, and our population protected from much of the unnecessary disease, suffering, and

death that now afflict them. The practice of drawing supplies of water from pump-wells, in villages, has over and over again been proved to be all wrong. No such practice should exist. Usually, however, it is not the fault of the local medical practitioners, or of the magisterial authorities, that pump-wells continue in daily use; but of the inhabitants generally, who dread the imposition of rates to secure not only a proper system of drainage, but of water-supply from pure sources. Evidently, there are people who would prefer exposing themselves and their families to deadly contagion and premature death, rather than pay a tax of so small a sum as a shilling a year. In such cases, there ought to be a peremptory application of the law by public officers of health.

## FOOTBALL.

BY AN OBSERVANT FOREIGNER.

THERE was a time when I regarded Poland as a land of patriotic heroes; but after living for a few months among the Hebrews of Warsaw, I began to see reasons for altering my opinion. At another period of my life I looked upon Italy, from a distance, as the abode of sunshine, art, and pleasure; but after living among brigands for nearly three weeks, I returned to my native France a wiser although a poorer man. I had discovered that hearsay, unless softened down by the admixture of a large grain of salt, should not be taken as truth, and that what is ordinarily called Romance, resolves itself, upon actual acquaintance, into the least attractive forms of villainy, immorality, extortion, and dirt. Although my eyes had thus been on two occasions opened by a process of painful experience, I could not altogether rid myself of an idea that Utopia existed somewhere or other for me; and where should it await me, I asked, if not in merry England. So I determined to explore the mysteries of England. We steamed up the Thames in a fog, thickened by the melancholy gloom of ubiquitous smoke, and broken in one place by a dull red spot, which, I was informed, denoted the place where the island sun ought to be. It was three o'clock in the afternoon, but it was nearly dark; and along the river-side the gas-lamps were already lighted, when I went ashore and waited until my baggage was hurled pell-mell upon the quay. After certain formalities had been gone through, I drove to the house of an English friend in Kensington, and soon had the pleasure of finding myself in one of the much-vaunted 'sweet homes' of England. Ah! there are carpets everywhere, and gas and water upon every floor. And there are great, guillotine-like windows opening on to balconies covered with pots of smoky flowers. Inside, everything has its covering or ornament. The pianoforte is surmounted by a mat, on which rests a bust of some German composer; and the chairs and lounges are clothed with lace. In the fire-place is a fire hot enough to roast a cow; and at its side are three steel utensils, which remind me of instruments of torture; and a coal-scuttle of the size of a bath.

But these things must not delay me, for my host, knowing that I have come to explore, has suggested that we go to see a football match on the afternoon of the next day, which is Saturday.

Saturday afternoon is, it appears, the great holiday of the English nation. Most of the shops are closed, many of the theatres are open, and amusement becomes the sole aim of the people whom the First Napoleon called 'a nation of shopkeepers.'

At one o'clock my friend and I set out for Clapham, where the football match is to be played. We go by train. My friend, by the way, tells me that football is a national pastime, and that it is universal throughout the country. It is, he says, as popular, or more so than cricket. Although it is damp and cold, I feel myself elated at the prospect of seeing the sport, especially as in the compartment with us are two fair-haired young men, who, I am informed, are going to take part in the game. They wear thick scarlet stockings of woollen, and knickerbockers of white flannel. Above, they are enveloped in a short, heavy coat. They have no cravats, and on their heads they have small caps of scarlet velvet with tassels of silver. One of them carries a large ball of leather, not just quite round, and which seems very hard, but is wonderfully light. They are good enough to allow me to examine it. I discover that it is tightly laced up with leather thongs over an inner case of india-rubber, which, I am told, is inflated by the breath until it becomes very hard.

At Clapham Junction we alight, and proceed to the common, a large open space covered with turf, on which are a few trees. The situation is picturesque, and there is a pleasant breeze; but the air is damp, and there is much fog.

A certain space having been marked out by small flags, two tall poles are erected at both ends of the course, and between them is stretched a piece of tape at a height from the ground of four or five metres. The length of the course is about one hundred and twenty metres, and its breadth about eighty. The object of the game is to send the ball between the two posts at the end of the ground possessed by the enemy.

There are many people on the common, and it appears that more than one match is about to be played. All the players have not yet arrived; so I walk about with my friend to keep myself warm. At a stall is a man who sells hot coffee and ices. The mixture is curious, but the man is not alarmed, and beats his chest with his hands, in order to warm himself, for the wind is brisk in the centre of the common.

Suddenly there is a shout, and the players, who have all arrived while I have been drinking my cup of execrable coffee, divest themselves of their coats, and allow me to see that their bodies are covered by thick, close-fitting 'jerseys.' I also notice that all the young men wear heavy boots. The game is about to commence.

On each side the players arrange themselves in front of the two tall poles, which my friend tells me are called the 'goals.' The members of one party wear scarlet jerseys, caps, and stockings; those of the other, blue. The effect is enchanting, for each one is strong, and has his biceps well developed. The leader of the 'blues' advances to the centre of the course with the ball, and with his heel makes an indentation in the ground, in which he places the inflated leather. Then he looks back, to see that his followers are prepared, and gives some directions, which the force of the breeze prevents me hearing. In the meantime,

we, the spectators, retire a short distance, and wait.

When his men are all satisfactorily arranged, the leader of the 'blues' steps back a few paces, and then, quickly running forward, deals the ball a blow with his foot, which sends it high in the air in the direction of the 'reds.' At the same moment the 'reds' run toward him with a shout, and one of them catches the ball in his arms. I am growing interested! Football is a noble sport! The 'red' who has seized the ball places it under his right arm, and charges towards the 'blues' with great precipitation, followed by nearly the whole of his comrades, who upset all the 'blues' with whom they meet. But, alas! my champion has been caught by a 'blue,' who with great dexterity has seized him by the jersey, and caused him to perform a pirouette, which ends in his fall on the ground. Horror! the jersey is torn, and the courageous player lies on his bare back under a mountain of friends and foes, struggling to retain possession of the ball. There are young ladies watching the sport, but they are not perturbed at the spectacle of the torn jersey. They only laugh, and clap their hands with the excitement. And this is English modesty! But the struggle on the ground continues; I can no longer distinguish the forms of the players; they are covered with mud; and of the 'red' who held the ball, only his stockings and boots are visible. He will be crushed! But no! I heard him cry plaintively from the midst of the mass, and his comrades disentangle themselves, and aid him to rise. He still holds the ball; and as he rises, he places it between his feet, and with his hands attempts to re-arrange his torn jersey. His comrades on both sides assist him. They are friendly and amiable. Surely they must be very good-tempered. But what is this? The players crowd round the unfortunate 'red' once more, supporting each other, while the possessor of the ball places it carefully within the circle formed by their muddy feet. Alas! they will kill each other. What terrible kicks! I can hear them; but I cannot see, for all the players are again, for some moments, mixed in inextricable confusion. I ask my friend if any one is hurt. He tells me coolly that this is only a 'hack through,' and that no one is very much hurt. Truly these English can suffer.

But now the ball has escaped from the crowd of feet, and is rolling across the course towards the goal of the 'reds.' A 'red' seizes it once more in his arms; but he is immediately kicked by a 'blue' until he falls and drops it. He is hurt, for there is blood on his lips, and he does not rise. It is horrible! There is a crowd at once, and a comrade goes for water to the coffee-stall. Ah! he is very pale, as he lies there on the grass. I ask my friend if he will die. He says that the 'red' has only broken a rib. I think that the 'blue' did it, but I am silent, for I am sick. Now the victim is carried away, and the game proceeds as before; but I tell my friend that I have seen sufficient of his national pastime, and that I am ready to return with him to home.

In the train he informs me that in England there are several kinds of football, each played in a different manner. What we have witnessed is the 'Rugby game.' It is the favourite mode of playing at many places. I am silent, for have not my ideas of the chivalrous nature of sympathetic

Englishmen received a rude shock? I had heard that the national pastimes were healthy and invigorating. I am convinced that one of them at least is brutal.

### THE STORAGE OF EXPLOSIVES.

SOME time ago, we noticed various inventions for the safe storage of gunpowder, and alluded incidentally to a device of W. H. Chambers, Deputy-commissary of Her Majesty's Control Department, that promised to secure perfect safety against explosion—in effect, a plan, so to speak, of rendering gunpowder fireproof. Since then, the invention has been thoroughly tested, and become the subject of a patent. The following account of experiments to test the magazine or vessel containing the explosive material has just appeared in the *Times* newspaper. It will be read with interest by those who require to keep gunpowder on their premises, and also by public bodies who have to adopt means for guarding against explosion.

The magazine is cylindrical or drum-shaped in form, and can be made of any required size, so as to conform to the exigencies of transport, and at the same time to be useful in storage. It consists of an outer casing of galvanised sheet-iron, pierced with several small holes, through which any moisture or steam may escape from the body of the magazine when subjected to great heat, the holes being plugged with red-lead. Next comes a lining of plaster of Paris in a concrete state one inch thick, and coated on its interior surface with a thin layer of Portland cement. Inside this again is a  $1\frac{1}{2}$ -inch thickness of plaster of Paris in powder and well pressed down. An intermediate casing of thin sheet-iron, galvanised, comes next, within which is a one-inch thickness of ground cork; and, finally, an inner lining of sheet-zinc. This forms the sides and bottom of the magazine, the lid being similarly constructed, and either screwed bodily into the mouth of the drum, so as to be easily removable, or hinged to it. In either case the lid is provided with proper fastenings, and the meeting edges of the lid and body are hermetically sealed. The portable magazines measure about thirty-two inches in height, with a diameter of twenty-eight inches, outside measurement; being but little larger than the portable magazines at present in use. The effect of this method of construction is to obtain a very low conducting power—so low that, on exposing a magazine to the heat of a fire sufficiently fierce to bring the outer casing to a welding heat, the temperature in the interior is raised to from  $214^{\circ}$  to  $219^{\circ}$  Fahrenheit only. Another result is that, while practically fire-proof, the magazine is also damp-proof. On exposing the magazine to heat, the contained powder remains uninjured, instead of being spoilt, as in some cases it is, by the vaporisation of chemicals, with the object of rendering the contents inexplosive. Before patenting his invention, Mr Chambers took the precaution to test his system. The tests were made by Messrs Miller and Herbert, engineers, of Heriotfield Works, Edinburgh. In test No. 1 a model drum-shaped magazine was made use of, which was composed of an outer iron skin, then plaster of Paris in powder,  $1\frac{1}{2}$  inch thick, then an intermediate iron skin lined with concrete plaster of Paris one inch thick. Inside this drum some gunpowder was placed, and the drum was then

immersed for twenty-four hours in a tank of water. Upon examination the powder was found to be perfectly dry, and no moisture whatever was indicated inside the magazine. Test No. 2 consisted in placing the same cylinder with the same powder in it in a plumber's fire for four and a half hours, a fierce fire being maintained meanwhile by the fan-blast. It was then removed from the fire, and left to cool; and when opened, the gunpowder was found perfectly good. In test No. 3 the same cylinder was placed in a smith's forge, a registering thermometer being placed inside. The cylinder remained in the forge until every part of the outer casing had become red-hot, a portion of it being at a welding heat, a strong fan-blast having been maintained the whole time. Upon examination the thermometer was found to have registered  $219^{\circ}$  Fahrenheit. The gunpowder was placed in the cylinder the moment the thermometer was withdrawn, but was not ignited. Upon dropping a lighted paper into the magazine, however, the gunpowder exploded, shewing that it had not suffered deterioration from the previous experiments. In test No. 4 a closed cylinder three inches thick, and composed of the non-conducting material only, without the iron casing, was kept in a reverberatory furnace for one hour and fifty minutes, a thermometer being placed inside. The exterior was exposed to a white-heat, which cracked the surface for about half an inch deep. The thermometer, however, registered an interior temperature of only  $215^{\circ}$ . In the final trial a cylinder was used composed of two inches of plaster of Paris, half an inch of cork, one inch of plaster of Paris, and again half an inch of cork, the lid being made in the same way, no metal being used. This cylinder was kept in a reverberatory furnace for two hours, at the end of which time the outer wall was cracked, as before, but the cork remained intact, the thermometer registering  $214^{\circ}$ .

### THE STRANGER'S GRAVE.

He sleeps within a nameless grave,  
Where Spring's luxuriant blossoms wave,  
For Summer's reign is nigh.  
The solitude around his tomb  
Is beautiful as Eden's bloom  
Ere beauty learned to die.

Her fairest and most fragrant flowers  
Kind May in bright profusion showers  
Upon that lovely spot;  
Where the sick heart and weary head  
Rest in their last dark, narrow bed,  
Forgetting and forgot.

No drooping mourners kneel beside  
That lonely grave at even-tide,  
And smother it with their tears;  
But oft the balmy dews of night  
Lave it in pity, when the light  
Of kindling stars appears.

No loved ones breathe the holy prayer,  
But Nature's incense fills the air,  
And seeks the distant sky.  
Her artless hymn the song-bird sings,  
The dreamy hum of insect wings,  
Are prayers that never die.

## THE KETTLE-DRUM.

THE gradual advance of dinner from six to seven o'clock, seven to eight o'clock, and even later, has thrown the system of daily meals, to speak mechanically, out of gear. One result is pretty observable. Luncheon, which used to be a trifling affair about or a little after mid-day, has expanded into a kind of dinner at two to three o'clock. Many, indeed, actually dine at that time, and make the late and ceremonious dinner little better than a bit of parade or sham. That is to say, in so-called fashionable society, there are two dinners in the day, at one of which people appear in ordinary morning attire, and at the other in evening dress. The protraction of the hour for the final meal of the day has, however, had another result. It has led to the interpolation of what is known as the kettle-drum or afternoon tea about five o'clock; and it is of this intermediate and uncereemonious refectation that we wish to say a few words.

The origin of the term 'kettle-drum' has never been clearly explained. A 'drum' used to be the name given to evening-parties a hundred years ago, and possibly 'kettle' has been prefixed to the word to impart the idea of a tea-kettle. Anyway, a kettle-drum happens to be a pleasant sort of meal—scarcely a meal at all, but only an excuse for meeting together in an easy manner at an interval when one has nothing else to do; while some will accept it as a welcome prelude to the onerous task of 'dressing for dinner.' The afternoon tea or kettle-drum has other uses. Men have now no leisure for breakfast-parties, even if they were inclined to talk before facing the day's work; and the ponderous formality of the dinner which fashion prescribes, to say nothing of its often finding men tired and jaded, forbids that free interchange of sentiments which renders Johnson's tavern dinners or the sociable feasts of Holland House so pleasant a retrospect in these days and nights of hurry. Much of the friendly talk of a country-house, or the liveliness of a London mansion, crystallises round the kettle-

drum. Mrs Jones and Mr Thompson have sat for five minutes in their hostess's drawing-room, looking prim and starched, and very frigidly abusing the hot weather. Suddenly, the lady of the house, with a bright thought, rings the bell; tea appears, and at once they thaw, while the conversation runs on again, sparkling through its ordinary channels. Or it has been a cold snowy afternoon in November; the women did not care to leave the house; *ennui* has reigned triumphant, and the painted ancestors on the walls have been frowning with gloomy brows on the modern fine ladies beneath; when suddenly tea is brought into that most charming room of a country-house, the inner hall or first drawing-room. Smiles forthwith brighten out, and a ripple of murmured chit-chat ensues. Then in walk Charlie and the captain in knickerbockers and shooting-jackets, while young Fitz and Major Stooks ride up to the door on their nags, all glad of civilised society after severe outdoor exercise, and thankful for the cup of tea, which at any other time they would despise. How pleasant, then, is the low easy-chair, the blazing braids on the 'dogs,' their flicker on the china and *bric-à-brac* around, the *petits-soins* of the ladies, only too glad to turn handmaids for the nonce, the heightened colour of Alice, the last new song warbled by Kate; until the bell warns the cosy party that it is time to dress for dinner.

But if that most agreeable refreshment, afternoon tea, has to answer for much of the scandal and uncharitable surmises of society, perhaps people do not settle down to this sorry employment with the same deliberation as the ladies, when they enter the drawing-room after dinner; still the light shafts which are sped are none the less dangerous from being unpremeditated. Tea has long had to suffer under the imputation of gossip, and afternoon tea quite keeps up its character. Little did that arch-gossip Pepys reflect, when he wrote in his Diary, on Sept. 25, 1660, 'I did send for a cup of tea, a China drink of which I had never drunk before,' that he was talking of a power which should hereafter fill so many diaries with gossiping trivialities.

Though afternoon tea is a product of advanced civilisation, its analogues may be found in the past. Thus Isidore, a grammarian of the seventh century, explains the Roman meal called *merenda*, concerning which antiquaries have always been puzzled, as having been 'food taken in the afternoon, to be eaten after mid-day, and just before dinner; whence,' he adds, 'certain call it *antecena*,' or dinner prelude. This exactly corresponds to our cup of tea taken in the afternoon just before dinner. So that in this case, as in so many others, there is nothing new under the sun. Lucullus gathered his guests around him in the shady arbour at his country-house for *merenda* on oppressive afternoons, just as cups of tea now solace our young people under the croquet tent, before the dressing-bell rings.

Leaving out of sight total agitation, the teacup has thus become to a certain extent a power in the state; nor is there much fear, at least in our own time, of its becoming a corrupt one. And yet it is from the natural process of development that a change may pass over its fortunes; its goodness die of a plethora. As soon as parliament abandons late sittings, dinner may perhaps return to a more sensible hour, lunch modestly put in its claims again, and the gunpowder of afternoon tea explode into empty space. A generation will grieve over it, and the philosophers of the future set themselves to speculate on its exact value amongst the fashionable agents of the nineteenth century. Finally, to be relegated in their opinion to that limbo of vanities whither ascend the cast-off delights of society.

Some thought it mounted to the lunar sphere,  
Since all things lost on earth are treasured there,  
There broken vows and death-bed alms are found,  
And lovers' hearts with ends of ribbon bound:  
Cages for gnats, and chains to yoke a flea,  
Dried butterflies, and tomes of casuistry.

Or, if we may venture to alter Pope—'afternoon bohea.'

## GLENCAIRN,

A DRAMATIC STORY IN THREE ACTS.

### SECOND ACT.

As much as two years elapse; the Edinburgh tradesmen have almost forgot that funny, though losing piece of business with Lord Glencairn, and his lordship has to all appearance vanished from the face of the earth. Glencairn, however, had only changed the scene of operations to the United States of America, and at the same time changed his designation. He was no longer a claimant for the Glencairn peerage, but a scion of the noble House of Gordon, if not actually Earl of Aberdeen. We have thought over what could be his lordship's reasons for honouring the Aberdeen family by the adoption of their surname, and have arrived at the belief that his choice of name was chiefly due to the possession of note-papers with the earl's coronet, and the monogram H. G., or G. H., just as you chose to read it. Possessing a quantity of these note-papers, his lordship needed to make no change. He was Hamilton, Lord

Gordon, or, if you like, George Hamilton Gordon, Earl of Aberdeen.

Whatever governed his lordship's choice of title, he cast up at St Paul, Minnesota, one of the western states of America, in the summer of 1870, shortly after having abruptly disappeared from London. At first he said little about himself, was modest in his bearing, and, with the money he had carried off, he was able to settle his bills regularly. While efforts were making to discover who he was, he placed himself in correspondence with the officers of the Northern Pacific Railroad, with the intention, as he said, of purchasing fifty thousand or sixty thousand acres of land on which to plant a Scotch colony. To purchase land in such a wholesale manner raised a high opinion of his wealth, while his note-papers, with the coronet, let it be understood that he was a man of rank. He was accordingly treated as a lord, and becoming the lion of the hour, he expressed himself as being grateful for all the kindness shewn him; in token of which he made some handsome presents of jewellery. What ensued, as described in a Minneapolis newspaper, reads like a novel.

'Being interviewed by the officers of the Pacific Railway regarding his proposed purchase of lands—"Yes," he said; "I do covet a few acres of your beautiful lands; not for myself—I have more than enough for my poor life—but for my dear sister, for the gratification of her benevolence. She would like to present to some of my old tenants lands in your free republic, where they may rear their families in peace and plenty; and to gratify my beautiful sister I would like to buy a few thousand acres—not many thousand, certainly say about fifty thousand acres or so—just a little for my poor people." Then there was a buzz! The office of the Northern Pacific was agitated. Here was a lord, who cared nothing for money, and who wanted a little bit of land—fifty thousand acres, for benevolent purposes. He would like to inspect it, of course, before purchasing. So they equipped a caravan, and led him promptly forth. It was the last of August when the princely retinue started from St Paul to the Northern Pacific, under command of Colonel Loomis, the deviser and commander of the excursion. Can the glories of that caravan be told? It was equipped for a lord. There were half-a-dozen teams with a carriage for Milord, besides the omnibuses, ambulances, &c. There were twelve men to do the manual labour; with a French cook and negro waiters in linen aprons and white gloves, and the royal table was unloaded from the baggage-wagons at every meal, and set out with fresh napkins, silver-plate, and china. It was truly gorgeous! Every luxury that the markets of Chicago, St Paul, and Minneapolis could produce was there; and all the game of the boundless prairie, from woodcock to buffalo. Champagne three times a day. When the caravan had skirted Oak Lake, Milord wanted to see Fergus Falls; and when he had done Fergus Falls, he longed for Morehead; and when he had digested

Morehead, he yearned to extend his excursion beyond the Red River. So on and on the deluded Loomis pressed, ever roweling the sable waiters, ever cajoling and reproaching the French cook, ever excited between anticipation and apprehension, and ever sending relays of messengers for more potted grouse, more cranberry jelly, and more champagne. In November the party came back half-frozen. Milord had selected his fifty thousand acres in Otter Tail and Beaver counties. The Northern Pacific Railroad Company footed the bills—fifteen thousand dollars for two months. The absurd farce was at an end. Milord Gordon did not buy the land for his poor tenants, and he never again mentioned his beautiful and benevolent sister to anybody.

Having travelled about for a few months, making himself acquainted with the various railway schemes of the country, Gordon in 1871 lighted down on New York, there, as we shall see, to commence business by appearing as a grand millionaire. He was the Right Honourable Lord Gordon, an English nobleman in the House of Lords, where he was always listened to with marked attention. He owned vast estates in Scotland, with a numerous tenantry, who were desirous to emigrate. He had come to America to seek out a locality where they might settle as a community; already he had made inquiries, and he designed to go westwards for the purpose. In two ways, this was a clever idea of his lordship. The Americans, with all their republicanism, are the most arrant tuft-hunters. They run after persons with a title, and, as has just been observed, a number of them are eager to get hold of any one who will buy large lots of land in the western part of the States. Lord Gordon was in request, almost treated like a prince. No doubt, great skill was required for the performance of his new rôle. But his lordship was fit for it all. With the easy composure of an English nobleman, his anecdotes of high life in London, his talk of lords and ladies at court, the off-hand narratives of his landed property and connections, his anxiety to be useful in promoting the emigration of his poor tenants, and his willingness to bear all the expense, brought him into notice. Horace Greeley believed in him, and took him up. More strange still, his lordship had the address to impose on Jay Gould, one of the acutest men of the age. This we consider to have been a really marvellous feat, and we must tell how it happened, drawing the more salient particulars from a volume of printed law-papers connected with the process of Gould *versus* Gordon in the supreme court, county of New York.

In his first affidavit before the court, Gould says: 'In the month of February last [1872], I was informed by Mr William Belden, that the Right Honourable Lord Gordon, otherwise known as the Earl of Aberdeen, a Scottish nobleman, was temporarily in the city; that he claimed to be largely interested in the stock of the Erie Railway Company, of which I was then President; and at

Mr Belden's request I sent him a complimentary pass over the Erie Railway.' For the compliment so handsomely paid, his lordship promptly despatched an acknowledgment by a note, which now lies before us; it is written in a scrawling aristocratic hand, surmounted by the earl's coronet and monogram, and is as follows: 'Lord Gordon presents compliments, and begs to acknowledge receipt of Complimentary Pass over the Erie Ry, of which he will be happy to avail himself in the event of his passing over the Line.' As it was subsequently represented that Lord Gordon, from his connection with English shareholders, had a controlling interest in the stock of the Erie Railway, Gould called on him at his rooms in the Metropolitan Hotel. At this juncture, it is to be understood, there was an approaching crisis in the management of the Erie Railway, and Gould was hopeful of being supported through his lordship's influence. All very well, one would say; but surely the first thing he ought to have done was to assure himself that Gordon had any influence at all. Mr Gould appears by a sort of infatuation to have been lulled into confidence by the wild pretensions and assumed title of the impostor, who led him to believe that he was possessed of large landed estates in Great Britain; that for many years he had been in receipt of an annual income of about three millions of dollars; and that he had already invested large sums in American securities. As for the Erie Railway Company he owned thirty million of dollars in the capital stock, and had the control of twenty more millions, owned by his friends in England; in short, that he and his friends possessed a majority in the concern, which was substantially in his power. It fills one with amazement to know that Gould in his credulity, and in the hope, as it were, of buying over Gordon, believed all this nonsense, and engaged to deposit with him in security, as a mark of his good faith in his lordship, property to the value of five hundred thousand dollars, to be returned on the election of the Board of Directors in the way reckoned on. Stocks as specified to the value of three hundred thousand dollars, with two hundred thousand dollars (forty thousand pounds) in money, were accordingly handed over. Did ever adventurer without a shilling he could call his own, and by dint of mere audacity, make such a tremendous haul?

Gordon, of course, failed to do what was expected of him, and Gould was furious on finding that he had been imposed on by a wretched interloper. Sending to London (when a little too late) to inquire as to the true character of his lordship, he ascertained that this magnificent personage could be nothing else than an impostor. Shocking revelation! The great Gould outwitted by an English adventurer! In the annals of villainy there was hardly anything more grotesque. Roused to a sense of his wrongs, Gould set the law to work, for which we are greatly obliged to him, as it lets us into a knowledge of a monstrously

nefarious affair. Gould, we can see, from his local knowledge and leanings, was too much for Gordon, who stood on the defensive. Yet, he had his solicitors, and shewed fight. He had a good deal to say for himself in the way of ingenious bamboozlement. He actually raised a counter-action, Gordon *versus* Gould, in which he endeavoured to maintain his claim to the property that had been indiscreetly put in his possession. In time, however, and by a little manœuvring, in which a judge was concerned, he, under pressure, gave back part of his plunder.

Abridging from an affidavit, we shall let Gould explain how he achieved this remarkable success through the friendly assistance of Mr William Belden, to whom he mentioned the circumstances. 'Mr Belden said that as Gordon had been a guest of his, and he knew him very well, he believed that if he could see him, he would return the moneys and securities which I had given him, without legal proceedings, or satisfy me they were not necessary. Belden and I then started to go to the Metropolitan Hotel for the purpose of seeing Gordon; on my way, having occasion to see Mr Tweed, who said he knew nothing of Gordon, but if I thought he was a swindler, I had better see Judge Shandley about him, who was then in the next room waiting to see him on business; he accordingly called Judge Shandley into the room where we were, and said to him that we wished to talk to him. We told the judge very briefly that a man stopping at the Metropolitan Hotel had obtained a large amount of moneys and securities from me, and that I had been led to think that he was probably an impostor, and meant to swindle me, and that we were going up to the hotel to see the man. I asked him what course I could pursue in case Gordon refused to give up the money and securities, and he said I could have him arrested, of course, on applying to any magistrate; he said he should be at the hotel that afternoon, and would be there very soon, and if I desired to do so, I could apply to him there for my man's arrest. Mr Belden and I went directly to the Metropolitan Hotel. I went immediately to room No. 112. I did not go into the billiard-room, or to the bar-room, but went directly to room No. 112, to which I have always had free access. There Mr Belden and I sat down, and I proceeded to give him a list of the securities which Gordon had belonging to me. While we were so occupied, Judge Shandley came in. It was suggested that we should need an officer, and a police-officer was procured. Mr Belden left the room to go to Gordon, and in a few minutes he returned, stating that Gordon [under a hint as to a police-officer and a warrant being at hand a few rooms off] was perfectly willing to hand back my money and securities; and thereupon I gave Mr Belden a note to the effect that he should represent me. Mr Belden went back to Gordon's room, and shortly after he returned, and handed me packages containing two hundred

thousand dollars, and also some of the securities which I had given to Gordon. Mr Belden told me that Gordon had promised to hand the balance of the securities to him that evening. I then left the hotel.' We gather from this that Gould recovered the money he had given to Gordon, but that a portion of the stock connected with certain undertakings remained to be surrendered. This stock, over which Gordon had no valid claim, and which he engaged to return that evening, was not returned. The promise to give it back to the rightful owner was illusory. Gordon had either disposed of it for his own advantage, or placed it for sale in the hands of stock-brokers at Philadelphia, where a process of restitution was instituted.

It is observable throughout this extraordinary litigation that much ignorance prevails in the United States regarding the British peerage and their titles. To clear up matters, it was found necessary to appeal to an expert, who made a business of giving advice respecting claims to coats of arms, and titular heritages in Great Britain. The knowledge of there being such a professional adviser does not quite surprise us, for we remember seeing an office in the Broadway, New York, where English coats of arms were adjudged and distributed as articles of merchandise. In the present instance, the expert was Robert Shelton Mackenzie, Doctor of Laws, at Philadelphia, who had made a special study of British peerage history, the rules of heraldry, and titles of honour. By this learned authority it was shewn that 'if there was a Lord Gordon, he would use the coronet of a baron, and not of the higher degree of an earl; and if there existed the son of a duke or marquis with the courtesy title of Lord George Gordon, he would not use his father's coronet, but simply the family crest, inasmuch as the law, not recognising titles of courtesy, would regard him as a commoner only; and any official statement would describe him as George Gordon, Esquire, commonly called Lord Gordon.' Then, as for the monogram, G. H., employed under the coronet in his note-papers, if meant to indicate George Hamilton Gordon, Earl of Aberdeen, it could not be correct, for the young Earl of Aberdeen was now travelling in Italy. In fact, the monogram with an earl's coronet was an unwarrantable assumption.

In the course of his judicial examinations, Gordon spoke of having transactions with one Count Charles Henry de Crano, residing in 'Cambridge Square, Notting Hill, London,' and whom he represented to be his step-father. It was deemed important to discover if there was any such mighty personage, or if he was only a flight of fancy. Communications were forthwith opened with the London authorities; and we have some diverting evidence of detectives and letter-carriers, regarding their efforts to discover a man who never existed; they might just as well have been sent travelling through London to find

out any of the heroes of Dickens's novels. George Greenham, of the Detective Department of the Metropolitan Police, being able to speak French, Italian, and German, declares before a magistrate at the Mansion House, that he had visited every house in Pembridge Square, Notting Hill, and every house in Cambridge Square, Paddington, but no De Crano was to be found. Besides this, he says, he visited not only all the private dwellings about Notting Hill, but all the provision-shops, butchers', bakers', grocers', chemists', and other shops, and that he could not find a single person who ever so much as heard of any one called De Crano. The legations of Austria, France, Spain, and Italy were equally ignorant on the subject. It was clear that De Crano was an invention. Next, we have a number of declarations, before magistrates, of noblemen—the Marquis of Huntly, the Earl of Aberdeen, and others—to the effect that they had no connection with, and knew nothing of the person styling himself Lord Gordon. Also, the affidavit of J. R. Planché, Somerset Herald, declaring that the bearing an earl's coronet over a monogram was an irregularity unknown to the laws of arms. In justice to Jay Gould, we must say he spared neither trouble nor expense to discover the character of the adventurer by whom he had been victimised.

Meanwhile, during these proceedings, Gordon felt that the net was closing around him. At the instance of Gould, on a charge of obtaining property on false pretences, he had been brought before a judge, and was only liberated on finding bail to a large amount. Had the case come to a regular trial, his lordship might possibly, by underhand means, not unknown in American law practice, have been acquitted. The case, however, never got the length of a trial. Gordon, to his dismay, heard that Jay Gould, in his indefatigable endeavours to procure a conviction, had taken steps to secure the attendance of Mr Smith of Marshall and Sons, and that, in fact, that gentleman was already on his way to New York. All, he now knew, would be lost unless Smith went to the bottom of the sea, or was somehow made away with on his arrival. Leaving Gordon in an unenviable state of suspense as to the possibly disagreeable upshot of his frauds, we drop the curtain on the second act, and leave the wind-up of the drama to a concluding paper. W. C.

#### ABOUT ICELAND.

CAPTAIN BURTON's visit to Iceland, of which the two volumes we are about to notice are a record, was made rather more than two years ago; but the delay in publication has distinct advantages. There may possibly be some loss of freshness in the narrative, though that is in general spirited enough, but there is a counterbalancing gain. The due amount of reflection which the interval between the date of Captain Burton's sojourn in Iceland and that of the publication of his book has enabled him to bestow upon his subject, has prevented anything like hasty or inartistic work; and the

perspective, proportion, and disposition of light and shade which the author has observed in the arrangement of his material, and which is very desirable in a book of this sort, would have been impossible, had it been more hurriedly done. Books upon Iceland have not been few, and it is probable that a good deal of exaggeration has been written concerning the country, especially in regard to its natural features. A perusal of Captain Burton's volumes leaves the impression of their being a candid, impartial, and trustworthy estimate of the subject. The author has not relied entirely upon the conceptions which he himself formed of the country and its people, but has carefully compared them with those of other travellers, making himself acquainted with almost everything that has been written that would be likely to assist him in his work. The result is an exhaustive book, wherein no aspect of the subject seems to be left untouched.\*

Captain Burton landed in Iceland, as was most natural, at the capital, Reykjavik. Reykjavik is a place which has made a fair amount of progress, considering the remoteness of its position, during the last half-century. Seventy years ago it was nothing more than a fishing village, containing some seven hundred inhabitants. It may now be considered a 'fair north-of-Europe port,' its population in 1870, when the census was last taken, being 2021, which is increased by about five hundred during the annual fair. The town is built on each side of a small and gradually sloping river-valley, which drains the Tjorn, a lakelet to the south, in extent about eight hundred yards long, by four hundred broad. The streets are for the most part well planned—straight, broad, and macadamised, but little can be said for their cleanliness. The drains are allowed to remain foul for long periods, and Reykjavik is pervaded throughout with 'an ancient fish-like smell,' against which, custom seems to have rendered the inhabitants proof. The houses are built with little regularity, chiefly of wooden frameworks of joists, filled 'with basaltic slabs, and mortar blue with dark sand,' and the walls are boarded over. Most of the houses have gardens, which are neatly kept, planted with vegetables and the hardier sorts of flowers and fruit-trees. In this direction great advance has been made by the Icelanders. In 1810, in Reykjavik, there was 'not a single garden or vegetable of any kind.' The most characteristic part of Reykjavik is that inhabited by the class of people called Tomthúsamen, or 'empty-house men,' the majority of whom are engaged solely in fishing. They form by far the largest portion of the community, and their dwelling-places are, in point of architecture, a composite of the Irish shanty, the cabin of the Far West, and the earth-covered hut of the Esquimaux. Their shape is an oblong parallelogram; the material of which they are built, basaltic blocks. Peats supply the place of mortar; the walls are sunk two or three feet below the ground; they possess generally two single-paned windows, and the steeply sloped turfed roofs 'yield a superior crop of grass.' A peculiarity of these houses is, that they appear as if gathering themselves together

\* *Ultima Thule: a Summer in Iceland.* By Captain Richard F. Burton. William P. Nimmo, London and Edinburgh.

and pushing forward against the wind, the rain, and the snow, as though compelled by an aggressive climate always to maintain the most defensive attitude possible.

Reykjavik was the centre from which Captain Burton made his several expeditions and explorations throughout the country. During the five months of his stay in Iceland, he became thoroughly acquainted with its physical characteristics, and with the past history as well as the present life and condition of its people. It is of this last point we would chiefly treat.

The estimates which different travellers have formed of the national character of the Icelanders vary greatly. One represents them as gloomy, ungenial, stubborn, suspicious, slothful, greedy, and unscrupulous; another writer, denying all this, calls them dignified, law-abiding, cheerful, frank, pious, contented, intellectual, hospitable, and not markedly addicted to any vice except that of drunkenness. As might be expected, the truth probably lies somewhere between these two extremes. Captain Burton has studied the Icelandic character closely, and describes it as nearly resembling that of other northern peoples, though, at the same time, isolation has preserved for it certain distinct national traits. The Icelanders are distinguished by truthfulness, mingling this truthfulness of their own, however, with a strong suspicion and distrust of others; in this resembling the Laplanders and other northernmen. As compared with the natives of Southern Europe, they are stolid and slow-witted. Having little at home to stimulate in them invention or enterprise, they are strongly conservative; but abroad they are without difficulty stirred to ambition and emulation. The Icelandic is a 'large-brained and strong-brained man,' naturally of a slow and solid mental habit, but capable of a high degree of education and culture. All the influences which surround him at home tend to make him indolent and phlegmatic; but abroad he becomes energetic, self-reliant, and courageous. What the Icelandic was a century ago, he is still. The manner of his life has altered very little during the past hundred years. While the rest of the civilised world has been advancing with such rapid strides, he has remained, perforce, almost stationary.

Education in Iceland is pretty generally diffused, but does not reach a high standard. All can, more or less, read and write; but, owing in a great measure to the thinness of the population, the pursuit of knowledge seems evidently to be carried on under difficulties. 'Learning among the Icelanders,' our author says, using a well-known quotation, 'is like bread in a besieged town; every man gets a mouthful, but no man a meal.' There are other places besides Iceland of which this could be said.

The wealth of Iceland consists chiefly in its grass-lands. Flocks and herds provide the most important means of livelihood to the people, and the chief source of industry and commerce. The fields are naturally grassed, not seeded, the plough and harrow being in little use. The grass is soft and thick, growing to a height of about six inches; and the hay made from it is of excellent quality and sweetness. White clover grows readily in the island, as do also potatoes and various other of the hardier sorts of garden produce. Attempts have at different times been made to introduce several

kinds of grain, but as yet without success; and it is still doubtful whether the warm season in Iceland is sufficiently long to ripen it. Moreover, the preliminary expense, which would have to be incurred before the experiment of grain cultivation could be properly made, such as the levelling of the soil, is greater than the farmers could afford. The best farms are on the north side of the island, the south-western coasts being inhabited chiefly by a fishing population. The homes of the agricultural and pastoral class nowhere form even the smallest village. Nothing that can be called a township is found except on the seaboard.

Three thousand five hundred boats, and about five thousand men, are employed in working the Iceland fisheries. The proportion of the population whose regular occupation is fishing is only one-tenth of that engaged upon the farms; but during the busy season of the year, large numbers of the peasants betake themselves to the coasts, and the whole activity and interest of the people are for the time centred upon fishing. It is this industry, Captain Burton affirms, which has 'determined more than anything else the modes and inspiration of the national life.' The three most important kinds of fishing are the cod, the shark, and the whale fishery. The western coasts, the most desolate in appearance beyond almost all other parts of the island, are especially rich in cod, and possess excellent spawning grounds. Amateurs of the rod find good sport in Iceland, but, generally speaking, of a pretty rough kind. 'The fish either rush at the bait, swallowing the food before it touches the water, or lie sulking, and will not be persuaded to rise.' All the lakes and rivers, except those which have their sources immediately in snow-mountains, are plentifully stocked with fish.

The female part of the population of Iceland is employed during winter chiefly in weaving and knitting, and during summer in spinning yarn. The loom—a primitive construction, not much superior seemingly, to that used among the ancient Egyptians and the inhabitants of Central Africa at the present day—is found in every farm-house. With it a clever hand will weave three yards a day. A favourite employment in Iceland is gathering eider-down, which occupies both men and women, and is carried on during the autumn and winter. In 1870 as much as 7909 pounds of down was exported from the island; but the profits of the industry are small. Other productions of the island are the well-known Iceland spar and Iceland moss, the former being crystallised carbonate of lime.

During his stay in Reykjavik, Captain Burton was hospitably entertained at the houses of several of the chief families, and found the society kindly and pleasant. Those whom he visited spoke English and French. The custom of drinking healths, which has almost entirely disappeared among us, is still kept up at Icelandic dinner-tables. The drinker bows, tilts his glass slightly forward towards the person whose health he is drinking, and bows again. A curious practice is observed when a fresh bottle of wine is drawn. Before helping your neighbour, you first spill a few drops into your own glass. The same custom prevails, Captain Burton tells us, in Brazil. At the conclusion of a dinner in Iceland, all rise, and whether previously introduced or not, bow or

shake hands with each other, and, with the host and hostess, exclaiming 'Velkomme.' The gentlemen do not continue sitting at the table after the ladies have left—a practice which some may think might be adopted with advantage in England, and which is indeed being already followed to a considerable extent among us.

Of course, Captain Burton visited Hekla and the Geysirs. He calls it 'indeed a Cockney trip;' but 'a visit to Iceland without it, would be much like Dante's *Commedia* with the Inferno omitted.' But Captain Burton's account of Hekla and the Geysirs differs markedly from the descriptions of former travellers, in that it is very much less enthusiastic and wonder-moving. Most of us have been accustomed from our school-days to regard these two natural phenomena as among the 'wonders of the world;' but Captain Burton's matter-of-fact narrative goes some way to dispel this idea in his reader's mind. But the reason that Hekla and the Geysirs failed to present to our author the same aspects of 'thrilling horror,' 'majestic grandeur,' and 'heavenly beauty,' as they apparently did to the majority of his predecessors, may probably to a great extent be explained by the fact, that he has seen so very much more of the marvellous in creation than most men. What might strike with wonder the traveller of average experience might easily stir no great amount of astonishment in one who has pretty nearly traversed the wide world over. He assures us, however, that 'the dozen intelligent English tourists' who were in Iceland at the same time as himself, all agreed in forming an estimate of what they saw corresponding with his own. We would not like to say that the opinion of any of these gentlemen was at all influenced by that of Captain Burton, and we cannot attempt to suggest how this statement may be reconciled with the description which we have of Hekla and the Geysirs by other travellers. Captain Burton would settle the matter by at once affirming that all previous accounts have been vast, though doubtless not wilful, exaggerations. 'The Hekla in reality,' he says, 'is a commonplace heap, half the height of Hermon, and a mere pigmy compared with the Andine peaks, rising detached from the plains; about three and a half miles in circumference, backed by the snows of the Tindafjall and Torfarjokull, and supporting a sky-line that varies greatly with the angle under which it is seen. A pair of white patches represent the "eternal snows." On the right of the picture is the steep but utterly unimportant Thrihyrngr, crowned with its benchmark; to the left the Skarösfjall, variegated green and black; and in the centre the Bjölfur, a western buttress of the main building, which becomes alternately a saddle-back, a dorsum, and an elephant's head, trunk, and shoulders.'

Captain Burton found the ascent of Hekla slow but comparatively easy work, two young English ladies accompanying his party. He had read of 'concealed abysses,' 'crevasses to be crossed,' places where 'a slip would be to roll to destruction;' but none of these were encountered by him. Our author went to Iceland with a strong conviction that much of exaggeration had been written about that country; so that we may consider that the estimate which he gives us of its natural phenomena has not received its tinge from any great feeling of disappointment, at any rate. The Geysirs

moved him to no stronger emotion of wonder than did Hekla. 'Nothing,' he writes, 'can be meaner than their appearance, especially to the tourist who travels as usual from Reykjavik; nothing more ridiculous than the contrast of this pin's point, this atom of pyritic formation, with the gigantic theory which it was held to prove, earth's central fire, the now obsolete dream of classical philosophers and "celebrated academicians;" nothing more curious than the contrast between Nature and Art, between what we see in life, and what we find in travellers' illustrations.'

Our author deals as fairly as he can both by his readers and those writers on Iceland from whose verdicts he feels bound to differ, in that he gives us liberal quotations from several of the latter, as a set-off to his own generally unenthusiastic narrative. It is as well that we, on our part, should supply our readers with at least a sentence from a traveller who has described the beauty of the Geysirs with a vivid pen: 'The charm of the Geysirs at Reykir could not be exceeded; the shafts, as they rose, curved outwards all round in perfect symmetry, a tree of live water, throwing off steam, but not sufficient to obscure its marvellous beauty, as the sun sparkled among its branches.' It is difficult to believe that the writer of the above did not actually behold something like the beauty which he here describes; and we must again bear in view that Captain Burton contemplated Hekla and the Geysirs with the memory still vivid in his mind of sights which he declares, and which we are ready to believe on his testimony, to be of infinitely greater beauty and grandeur, such as 'the jetting boiling water near the beautiful Lake Rote-ma in New Zealand,' and the Yellowstone region in North America, where, as in the New World generally, 'every feature, lakes and cataracts, forest and cañon, is on a scale unknown to the Old.' But while Captain Burton writes thus of Hekla and the Geysirs, it must not be supposed that he met with no scenery in Iceland that awakened his admiration. In proof of this, and in justice to the country, since our quotations have been rather in the direction of disparaging its natural wonders, we would like, had space permitted, to have been able to give our author's description of a sunset view which he obtained of the Vatnajökull—a very glowing, yet not overdone picture.

Captain Burton set before him a definite object in writing these volumes—namely, to encourage, if possible, the further development of Iceland. He considers that the principal means by which this may be done are three: the working of the sulphur-mines; a thorough reform and improvement of the appliances at present in use among the fishing population of the island; and the extension of emigration. That a well-organised system of emigration would do much for Iceland, there seems to be little doubt. Thinly peopled as the country is, the population has in certain parts become too dense for the capabilities of the soil, and the conditions of life are at best hard. The emigration movement has not as yet been fairly tested, but the disposition of the people themselves is favourable to it, though the official authorities at Reykjavik at present discountenance it. The prejudices of the latter will probably, ere long, give way; and we find the Norwegian papers, which circulate widely throughout the island, and

the learned Dr Hjaltalin—an authority on most matters connected with Iceland—strongly recommending a systematised emigration. The Icelanders, strong of body and brain, would make such a settler as the Canadian government, or that of any of our Australian colonies, might be glad to welcome; while at home he is frequently little better than an idler, from sheer lack of an adequate stimulus to labour and enterprise. The terse epigrammatic way in which our author sums up the whole *rationale*, as we may call it, of emigration is worth quoting. For many years he has wondered 'how or why a poor man ever lives in England, or a rich man in America.' Possibly Captain Burton would say the same in regard to emigration to all our various colonies; but is it not lucky for these that every one is not of the same opinion? It would be rather hard on America and our colonies if all successful settlers were to desert their shores as soon as they had become rich and serviceable to the state.

The other two means by which Captain Burton believes the temporal well-being of the Icelanders is capable of great improvement—namely, the further development of the fisheries and the sulphur mines—are treated in detail with great care and completeness.

## THE FLAG OF DISTRESS.

### CHAPTER XLI.—PANAMA! OR SANTIAGO!

It is the hour for setting the first night-watch, and the bells have been struck; not to summon any sailor, but only intended for the ears of Captain Lantanas in the cabin below, lest the absence of the usual sound should awake suspicion. The men of both watches are on deck; assembled by the manger-board, to take measures for carrying out their scheme of piracy and plunder, now on the eve of execution. The general plan is already understood by all; it but remains to settle some final details.

Considering the atrocity of their design, it is painful to see the first-mate, Harry Blew, in their midst. O man! O British sailor! where is your gratitude? What has become of your honour—your oath? The first gone, the second disregarded, the last broken!

Soon as together, the pirates enter upon discussion. The first question which comes before them is about the place where they shall land. Upon this point there is difference of opinion. Some are for going ashore at once, on that part of the coast in sight. Others counsel running on till they enter Panama Bay. At the head of those in favour of the latter course is the chief-mate, while the majority, controlled by Gomez and Padilla, take an opposite view. Gomez, who is their spokesman, argues in favour of landing, soon as they can find a suitable place, and making direct for Santiago, the chief town of Veragua. He gives his reasons, saying:

'It isn't over a good day's journey from the coast. And we can reach it by an easy road. But that's not the thing of greatest importance. What most concerns us is the safety of the place when we get to it—and I can answer for Santiago. Unless customs have changed since I used to trifle away some time there, and people too, we'll find those who'll shew us hospitality. With the

money at our disposal—ay, a tenth part of it—I could buy up the *alcalde* of the town, and every judge in the province.'

'That's the sort of town for us—and country too!' exclaim several in a breath.

'We'll first have to put about,' explains Gomez, 'and run along the coast, till we find an opening in the reef.'

'Yes,' rejoins Harry Blew, speaking satirically, and as if annoyed by the majority going against him. 'An' if we put about just now, we'll stand a good chance of goin' slap on them rocks on the port beam. Thar's a line o' white caps along shore, far's I can see. How's a boat to be got through them? She'd be bilged to a sartinty.'

'There are breakers,' admits Gomez; 'but not continuous; I remember there are several openings where a boat, or a ship for that matter, may be safely got through.'

'*Vaya, camaradas!*' exclaims Padilla, with a gesture of impatience. 'We're wasting time, which just now is valuable. Let's have the barque about, and stand along the coast, as Gil Gomez proposes; I second his proposal; but if you like, let it go to a vote.'

'No need; we all agree to it.'

'Yes; all of us.'

'Well, shipmates,' says Harry Blew, seeing himself obliged to give way, and conceding the point with apparent reluctance; 'if ye're all in favour o' steerin' up coast, I an't goin' to stand out against it. It be the same to me one way or t'other. So to Santiago let's go. But if the barque's to be put about, I tell ye there's no time to be lost. Otherways, we'll go into them white caps, sure, the which wud send this craft to Davy Jones sooner than we intended.'

'Plenty of sea-room,' says the second-mate, 'if we about with her at once!'

'You see to it, Padilla!' directs Gomez, who, from his success in having his plan adopted in opposition to that of the first-officer, thinks he may now take command.

The second-mate starts aft, and going up to the helmsman, whispers a word or two in his ear. Instantly the helm is put hard up, and the barque paying off, wears round from east to west-nor-west. The sailors at the same time brace about her yards, and trim her sails for the changed course; executing the manœuvre, not, as is usual, with a chorused chant, but silently, as if the ship were a spectre, and her crew but shadows!

The barque is now about a league's distance from land; and half-way between are the breakers, their roar sounding ominously through the calm quiet of the night. The vessel making but little way—only two or three knots an hour—one proposes that the boat be lowered at once, and such traps as they intend taking put into her. In such a tranquil sea it will tow alongside in safety. As this will be so much work in advance, the plan is approved of; and they proceed to its execution; the pinnace being selected, as the most suitable boat for beaching. Clustering around it, they commence operations. Two leap lightly into it, ship the rudder, secure the oars and boat-hooks, clear the life-lines, and cast off the lanyards of the gripes; the others holding the full-tackle in hand, to see that they are clear for running. Then taking a proper turn, they lower away.

Other movements succeed; the pirates passing to

and from the fore-castle, carrying canvas bags, and bundles of clothing, with such other of their belongings as they deem necessary for a debarkation like that intended. A barrel of pork, another of biscuit, and a beaker of water, are also turned out, and handed down into the boat; not forgetting a keg containing rum, and several bottles of wine they have purloined from the ship's stores.

In silence, but with no great show of caution or stealth, are all these movements made. They have but little fear of being detected, some scarce caring if they be. Indeed, there is no one to observe them, who is not taking part. For the negro cook, after dressing the dinner, and serving it, has gone out of the galley for good, and now acting as steward, keeps below in the cabin waiting on the guests at table.

Soon everything is stowed away in the pinnace, except that which is to form its most precious freight; and again the piratical crew bring their heads together, to arrange about the final step; the time to take which is fast drawing nigh. A thing so serious calls for calm deliberation, or, at all events, there must be a thorough understanding among them. For it is the disposal of those they have destined as the victims of their villainy. All quite understand how this is to be done, though nothing definite has yet been said of it. Even the most hardened among them shrinks from putting it in plain words. Still is it tacitly understood; the ladies are to be taken along, the others to be dealt with in a different way.

For a time they stand silent, waiting for one who has the hardihood to speak. There is one who has all this, a ruffian of unmitigated type, whose breast is not moved by the slightest throb of humanity. It is the second-mate, Padilla. Breaking silence, he says: 'Let's get the women into the boat, and heave the others overboard, and have done with it!'

The horrible proposition, despite the auditory to whom it is addressed, does not find favourable response. Several speak in opposition to it; Harry Blew first and loudest. Though broken his word, and forfeited his faith, the British sailor is not so abandoned as to contemplate murder in such a cool deliberate manner. Some of those around him have no doubt committed it; but he does not yet feel up to it. Opposing Padilla's counsel, he says: 'What need for our killin' them at all? For my part, I don't see any.'

'And for your part, what would you do?' sneeringly retorts the second-mate.

'Give them a chance for their lives.'

'How?' promptly asks Padilla.

'Why; if we set the barque's head out to sea and trim her sails right, as the wind's off-shore, she'd soon carry them beyont sight o' land, and we'd niver hear another word about 'em.'

'Curra!' exclaims Padilla scornfully; 'that would be a wise way. Just the one to get our throats in the *garrota*. You forget that Don Gregorio Montijo is a man of the big grandee kind. And should he ever set foot ashore after what we'd done to him, he'd have influence enough to make most places, if not the whole of the earth, too hot for us. There's an old saw, about dead men telling no tales. No doubt most of you have heard it, and some know it to be a true one. Take my advice, *camarados*, and let

us act up to it. What's your opinion, Señor Gomez?'

'Since you ask for it,' responds Gomez, speaking for the first time on this special matter, 'my opinion is that there's no need for any difference among us. Mr Blew's against killing them, and so would I, if it could be avoided. But it can't with safety to ourselves; at least not in the way he has suggested. To do as he says would be madness on our part—more, it might be suicide. I think I know a way that will save us from actually murdering them, and secure our own safety all the same.'

'What way?' demand several voices.

'One simple enough; so simple, I wonder you haven't all thought of it, as well as I. Of course, we intend sending this pretty craft to the bottom of the sea. But she is not likely to go down till we're a good way off altogether out of sight. We can leave them aboard, and let them slip quietly down along with her!'

'Why, that's just what Blew proposes,' say several.

'True,' returns Gomez; 'but not exactly as I mean it. He'd leave them free to go about the ship—perhaps get off her when she sinks, on a sofa, or spar, or something.'

'Then how would you do with them?' asks one impatiently.

'Bind the gentlemen before bidding them adieu.'

'Bah!' exclaims Padilla, a monster to whom cold blood seems congenial. 'What's the use of being at all that bother! It's sure to bring trouble. The skipper will resist, and so'll the old Don. What then? We'll be compelled to knock them on the head all the same, or toss them overboard. So let's put a stopper on them at once!'

'Why, man!' cries Striker, hitherto only a listener, but a backer of Harry Blew; 'you 'pear to 'a been practisin' a queery plan in jobs o' this sort. That o' Gomez be far the best way, same as I've seed in the Australian bush, where they an't so blood-thirsty. When they stick up a chap theer, so long's he don't cut up nasty, they settle things by splicin' him to a tree, an' leavin' him to his meditations. Why can't we do the same wi' the skipper an' the Don—supposin' 'em to shew refractory!'

'That's it!' exclaims Davis, strengthening the proposal thus endorsed by his chum Striker. 'My old pal's got the correct idea of sich things.'

'Besides,' continues the older of the ex-convicts, 'this job seem to me simple enuf. We want the swag, an' some seems to be wantin' the gals. Well; we can git both 'thout the needcessity o' doin' murder!'

'I tell you what,' interposes Harry Blew, 'for myself, as I've said, I object to killing or the sight o' blood, where it an't a absolute needcessity. True, by leavin' them aboard an' tied, as Mr Gomez advises, they'll get drowned, for sartin; but it'll keep our hands clear o' red murder!'

'That's true!' cry several in assent. 'Let's take the Australian way of it, and tie them up!'

The assenting voices are in the majority; and the compromise suggested by Gomez is carried. So far everything is fixed. It but remains to arrange about the action, and apportion to every one his part. This soon settled; the first-officer, assisted by Davis, who has some knowledge of ship-

carpentry, is to see to the scuttling of the vessel; Velarde and Hernandez to take charge of the girls, and get them into the boat; Gomez to see to the steering of the vessel; the second-mate to head the party intrusted with the seizure of the gold; while Striker and the Frenchman are to tie up the unfortunate men whose lives are to be sacrificed. The atrocious plan is complete in all its revolting details—the hour of its execution at hand.

#### CHAPTER XLII.—THE DREADED TINTORERAS.

With all sail set, the barque glides silently on—to her doom! Gomez has taken charge of the steering, he alone having any knowledge of the coast. They are less than a league from land, shaving close along the outer edge of the breakers. The breeze now blowing off-shore makes it easy to keep clear of them.

There is high land on the starboard-bow, gradually drawing more distinct. Gomez fancies he remembers it. And soon is sure; for in the clear moonlight is disclosed the outline of a hill, which, once seen, could not easily be forgotten; a *cerro* with two summits, and a *col* or saddle-like depression between.

Yes; he is certain he has seen that double-headed hill before. Still, though a conspicuous landmark, it does not point out any landing-place, only that they are entering the great gulf which here indents the Veraguan coast.

As the barque moves on, bringing the hill abeam, he sees a reach of clear water opening inland. To all appearance a bay, with mouth miles in width.

He would run into it, but is forbidden by the breakers, whose froth-crested belt extends across its entrance from cape to cape. Running past, he again closes on the land, now within less than a league, and soon has the two-headed hill abeam, its singular silhouette conspicuous against the moonlit sky; all the more from the moon being beyond and low down, shewing between the twin summits like a great globe lamp there suspended. When nearly opposite, he observes an open space in the line of breakers, easily told by its dark tranquil surface, which contrasts with the white horse-tails lashing up on each side of it.

Soon as sighting it, Gomez drops the wheel, intrusting it to the Dutch sailor; as he does so, giving the latter directions how to steer. Then leaving the poop he proceeds towards the ship's waist, where he finds all the others ready for action. Striker and La Crosse with pieces of rope for making fast the ill-fated men; Padilla and his party armed with axes and crowbars—the keys with which they intend to open the locker-doors.

Near the main-mast stands the first-mate, a lighted lantern in his hand, Davis beside him, with auger, mallet, and chisel. They are by the main-hatchway, which they have opened, evidently intending descent into the hold. With the lantern concealed under the skirt of his ample dreadnought, Harry Blew stands within the shadow of the mast, as if reflecting on his faithlessness, ashamed to let his face be seen. He even seems reluctant to proceed in the black business, while affecting the opposite. As the others are now occupied in various ways, with their eyes off him, he steps out to the ship's side, and looks over the rail. The moon is now full upon his face, which, under her soft innocent beams, shews an expres-

sion difficult as ever to interpret. The most skilled physiognomist could not read it. There is sign of more than one emotion striving within his breast, mingling together, or succeeding each other, quick as the changing hues of the chameleon. Now, it seems guilty cupidity, now remorse, anon the dark shadow of despair! The last growing darker, he draws nearer to the side, and looks more earnestly over, as if about to plunge into the sea, and so rid himself of a life ever after to be a burden!

While standing thus, apparently hesitating as to whether he should drown himself, and have done with it, soft voices sound in his ears, mingling their tones with the breeze, as it sighs through the rigging of the ship. Simultaneously there is a rustling of dresses, and the moment after he sees two female forms, robed in white, with shawls over their shoulders, and kerchiefs covering their heads. Stepping out on the quarter-deck, they stand for a short while, the moon shining on their faces, both bright and cheerful as her beams. Then they stroll aft, little dreaming of the doom that awaits them.

Their unsuspecting innocence should soften his traitorous heart. Instead, it seems to steel it the more—as if their presence but recalled, and quickened within him some vow of revenge. He hesitates no longer; but gliding back to the hatch, climbs over its coaming, and lantern in hand, descends into the hold—there to do a deed which light of moon, or sun, should not shine upon.

Though within the tropics, and but a few degrees from the equatorial line, there is chillness in the air of the night, now nearing its mid-hours. Drawing their cloaks closely around them, the young ladies mount up to the poop, and stand resting their hands on the taffrail. For a time they are silent; their eyes turned astern, watching the foam in the ship's wake lit up with dancing phosphorescence. They observe other sparkling scintillations beside those in the *Condor's* wake. There are broad splashes of it all over the surface of the sea, with here and there elongated *sillons*, seemingly made by some creatures in motion, swimming parallel to the ship's course, and keeping pace with her. The two girls have not voyaged through thirty degrees of the Pacific Ocean to be now told what these are. They know them to be sharks, as also that some of larger size and brighter luminosity are those of the *tintorera*—that species so much dreaded by the pearl-divers of Panama Bay and the Gulf of California. This night, both *tiburones* and *tintoreras* are more numerous than they have before observed them—closer also to the vessel's side; for the sharks, observantly, have seen a boat lowered down, which gives anticipation of prey nearer reach of their ravenous jaws.

'*Santissima!*' exclaims Carmen, as one makes a dash at some waif drifting astern. 'What a fearful thing it would be to fall overboard in the midst of those horrid creatures! One wouldn't have the slightest chance of being saved. Only to think how little space there is between us and certain death! You see that monster just below, with its great, glaring eyes! It looks as if it wanted to leap up and lay hold of us. Ugh! I mustn't keep my eyes on it any longer. It makes

me tremble in a strange way. I do believe, if I continued gazing at it, I should grow giddy, and drop over into its jaws! Sobrina, are you not glad we're so near the end of our voyage?

'I'm not sorry, *tia*—I fancy no one ever is. I should be more pleased, however, if it *were* the end of our voyage, which unfortunately it isn't. Before we see Spain, we've another equally as long.'

'True—as long in duration and distance. But otherwise, it may be very different, and I hope more endurable. Across the Atlantic we'll have passage in a big steam-ship, with a grand dining-saloon and state sleeping-rooms, each in itself as large as the main cabin of the *Condor*. Besides, we'll have plenty of company—passengers like ourselves. Let us hope they may turn out nice people. If so, our Atlantic voyage will be more enjoyable than this on the Pacific.'

'But we've been very comfortable in the *Condor*; and I'm sure Captain Lantanas has done all he could to make things agreeable for us.'

'He has indeed, the dear good creature; and I shall ever feel grateful to him. Still you must admit, that however well meant, we've been at times a little bored by his learned dissertations. O *Inez*, it's been awfully lonely and frightfully monotonous—at least, to me.'

'Ah! I understand. What you want is a bevy of bachelors as fellow-passengers, to enliven one. Well; I suppose there will be in the big steamer. Like enough, a half-score of our mustached *militarios*, returning from Cuba and other colonies. Wouldn't that make our Atlantic voyage enjoyable?'

'Not mine—nothing of the sort, as you know, *Inez*. To speak truth, it was neither the loneliness nor monotony of our Pacific voyage that has made it so miserable. Something else.'

'I think I can guess the something else.'

'If so, you'll be clever. It's more than I can.'

'Might it have anything to do with those cold parting compliments, and the informal leave-taking? Of course it has. Come, Carmen! You promised me you'd think no more about that, till we see them in Cadiz, and have it all cleared up.'

'You're wrong again, *Inez*. It is not anything of them.'

'What then? It can't be the *mal de mer*? Of it I might complain. I'm even suffering from it now; although the sea is so calm. But you! why you stand the sea as well as one of those rough sailors themselves! You're just the woman to be a naval officer's wife; and when your *norio* gets command of a ship, I suppose you'll be for sailing all round the world with him.'

'You're merry, *mora*.'

'Well; who wouldn't be, with the prospect of so soon setting foot on land. For my part, I detest the sea; and when I marry my little *guardia-marina*, I'll make him forsake it, and take to some pleasanter profession. And if he prefer doing nothing, by good-luck the rent of my lands will keep us both comfortably, with something to spare for a town house in Cadiz. But come, Carmen! Tell me what's troubling you? Surely you must know it.'

'Surely I don't, *Inez*. I can't tell myself.'

'That's strange, a mystery. Might it be regret at leaving behind your *preux chevaliers* of California—that grand, gallant De Lara, whom, at our last interview, we saw sprawling in the road-dust?

You ought to feel relieved at getting rid of him, as I of my importunate suitor, the Señor Calderon. By the way, I wonder whatever became of them? Only to think of their never coming near us to say good-bye! And that nothing was seen or heard of them afterwards! Something must have happened. What could it have been? I've tried to think, but without succeeding.'

'So I the same. It is indeed very strange; though I fancy father heard something about them which he does not wish to make known to us. You remember what happened after we'd left the house—those men coming to it in the night. Father has an idea they intended taking his gold, believing it still there. What's more, I think he half suspects that of the four men—for there appear to have been four of them—two were no other than our old acquaintances—she had almost said suitors, but the word gives her a spasm of pain—'Francisco de Lara and Faustino Calderon.'

'*Maria de Merced*!' exclaims *Inez*. 'It's frightful to think of such a thing. And we ought to be thankful to the good saint for saving us from such villains; as glad to get away from a country where their like are allowed to live.'

'Sobrina, you've touched the point. The very thought that's been distressing me is the remembrance of those men. Even since leaving San Francisco, as before we left, I've had a strange heaviness on my heart—a sort of boding fear—that we haven't yet seen the last of them. It haunts me like a spectre. I can't tell why, unless it be from what I know of De Lara. He's not the man to submit to that great defeat of which we were witnesses; he assured he will seek to avenge it. We expected a duel, and feared it. Likely there would have been one, but for the sailing of the English ship. Still that won't hinder such a desperate man as Don Francisco from going after Señor Crozier, and trying to kill him, any way he can. I have a fear he'll follow him—is after him now.'

'What if he is? Your *fiancé* can take care of himself. As so can mine, if Calderon should get into his silly head to go after him. Let them go, so long as they don't come after us; which they're not likely—all the way to Spain.'

'I'm not so sure of that. Such as they may make their way anywhere. Professional gamblers—as we now know them to be—travel to all parts of the world. All cities give them the same opportunity to pursue their outlawed calling—why not Cadiz? But, *Inez*, there's something I haven't told you, thinking you might make mock of it. I've had a fright more than once—several times, since we came aboard the *Condor*.'

'A fright! what sort of a fright?'

'If you promise not to laugh at me, I'll tell you.'

'I promise. I won't.'

'Would be no laughing matter were it true. But, of course, it could only be fancy.'

'Fancy about what? Go on, *tia*! I'm all impatience.'

'About the sailors on board. All have bad faces; some of them like very *demonios*. But there's one has particularly impressed me. Would you believe it, *Inez*, he has eyes exactly like De Lara's! His features, too, resemble those of Don Francisco, only that the sailor has a great beard and whiskers, while he had none. Of course the

resemblance can be only accidental. Still, it caused me a start, when I first observed it, and has several times since. Never more than this very morning, when I was up here and saw that man. He was at the wheel, all by himself, steering. Several times, on turning suddenly round, I caught him looking straight at me, staring in the most insolent manner. I had half a mind to complain to Captain Lantanas; but reflecting that we were so near the end of our voyage'—

She is not permitted to say more. For at the moment, a man springing up to the poop, as if he had risen out of it, stands before her; the sailor who resembles De Lara! Making a low bow, he says:

'Not *near* the end of your voyage, señorita—but *at it*,' adding with an ironical smile: 'Now, ladies! you are going ashore. The boat is down; and, combining business with pleasure, it's my duty to hand you into it.'

While he is speaking, another of the sailors approaches *líez*. It is Hernandez, who offers his services in a similar strain.

For a moment, the young ladies are speechless, through sheer surprise. Horror succeeds, as the truth flashes upon them. And then, instead of coherent speech, they make answer by a simultaneous shriek; at the same time attempting to retreat towards the companion-stair.

Not a step is permitted them. They are seized in strong arms; and half-dragged, half-lifted off their feet, hurried away from the taffrail. Even their cries are hindered, by huge woollen caps drawn over their heads, and down to their chins, almost stifling them. Though no longer seeing, and but indistinctly hearing, they can tell where they are being taken. They feel themselves lifted over the vessel's side, and lowered down man-ropes into a boat; along the bottom of which they are finally laid, and held fast—as if they had fallen into the jaws of those terrible *tintoreros* they saw keeping company with the ship!

#### THE WESTMINSTER AQUARIUM.

But a short while since, and no sign of the promised Westminster Aquarium met the eye of the passers-by, save a square black board with the words, 'This is the Site of the Westminster Garden and Aquarium,' and a row of palings, and some workmen engaged in excavating the ground, from which were eventually to rise the fair proportions of a vast and beautiful structure.

Now, the towering dome and noble sculptured walls of the promised palace of delight are no longer mere castles in the air; day by day adds to their beauty, and brings them nearer to completion; and on the 10th of December, it is expected that the Winter Garden and Aquarium, the warm, cosy home provided for rare trees and plants and flowers, the mighty tanks of sea-water wherein shall sport sea-creatures innumerable, will be thrown open to the public, and inaugurated by a fête. Though no one could possibly have a word to say against our old and tried friends, the Crystal and Alexandra Palaces, still it must be admitted they labour under the same disadvantages as people whom we like very much indeed, living at a great distance from us, of whom we cannot pos-

sibly see as much as we could wish, because of the time it takes to get to them.

Length of journey is a matter of no small moment to those who are desirous of amusing themselves to the utmost, and are not gifted with an unlimited income wherewith to do so. Now, the Westminster Aquarium will be within an easy journey from almost all parts of London, either by the Metropolitan Railway or omnibus; and thus the means of enjoying the best music, and of revelling in the sight of the brightest gems of art, will be within easy grasp of the great mass of the people, and that at even less than ordinary cost of travel, since the Underground Railway is to issue tickets for the Aquarium at reduced fares. That Mr Arthur Sullivan has undertaken the directorship of the musical part of the programme, is sufficient guarantee for the order of melody with which our ears will be greeted, and which we know will be at once attractive to the mass of the people, and agreeable to the most refined and fastidious connoisseur; while the name of Mr Loyd, as manager of the aquaria with which the building will abound, brings before our mind's eye a vision of tanks, crystal clear, wherein aquatic creatures of every conceivable form congregate. We know that the elegant movements of the flat-fish will delight our eyes with their wonderful undulating progression through the water; and that the horrible *Prieure*, looking like the denizen of Victor Hugo's cave, seen through a diminishing glass, will display his dreadful eyes and parrot-like beak to our present edification and subsequent nightmare.

Aquaria open to the naturalist the most admirable means of careful observation, whereby not only the habits of fishes, and still lowlier forms of life, may be closely studied, but the mind led to appreciate the varied and marvellous beauties of form, and modes of progression, of many animals which we have been in the habit of considering commonplace and valueless, beyond their usefulness as mere articles of food. Who, for instance, seeing the common flat-fish, such as sole and plaice, lying on the slab of a fishmonger's shop, could imagine that, seen in their native element, these creatures present that graceful ribbon-like appearance which no one who visits an aquarium fails to be delighted with?

In this respect—namely, combining instruction with amusement—the Westminster Aquarium will be peculiarly happy, as every possible facility is to be given for the delivery of popular lectures, and an extensive library provided.

The idea of this undertaking originated with Mr Wybrow Robertson; and a long list of influential names composes the Council of Fellows; while Mr Bruce Phillips, a son of the late Dr Samuel Phillips, has undertaken the duties of secretary. Mr Phillips appears to be a man of great energy; has already a brilliant reputation as an essayist and reviewer, and has worked at the Crystal Palace under Mr George Grove.

We may, then, safely say that the Westminster Aquarium—this new queen amidst the beauties of London—will make a début in which everything unites to secure a brilliant success; and it is no small advantage, that admission to her court will be obtainable for the small sum of one shilling, so that the working-man can enjoy all the numerous resources of that court, equally with the upper

ten-thousand. It is now time for us to say something as to the appearance and arrangement of this vast building.

It covers a ground space of nearly three acres, the land of which cost fifty thousand pounds. The structure itself is about six hundred feet long, and two hundred and forty feet in its greatest width. Constructed of red brick and Portland stone, there appear at intervals gracefully sculptured groups of double cornucopias, of flowers and fruits, alternating with other groups formed of twin-dolphins; while over the main entrance stands a fine figure of Britannia, who aspires, apparently, not only to rule the waves of the ocean, but also the ripples of the aquarium at Westminster.

Some fine granite pillars ornament the upper end of the building, and an arched roof of glass spans the whole. The interior will have two stories, and the great salt-water tank will hold no less than six hundred thousand gallons; a volume of water that is expected to be kept fresh for a period of ten years, by means of a complicated machinery, which will keep it in perpetual motion.

Doubtless, a grand collection of sea-anemones, and all those beautiful creations which stand on the border-land between the vegetable and animal world, will be gathered together, and viewed with delight. Nor will pleasant accessories be wanting. The orchestra, that is to be capable of containing a thousand performers, and the large organ, sound suggestive of an ample musical provision. Indeed, we are promised a concert twice daily, one in the afternoon, the other in the evening. On Sunday afternoon, the Winter Garden is to be open to Fellows and those friends on whom they may be graciously pleased to bestow 'orders,' so that a rival to the 'Zoo' will exist, and one that is far more easily reached. Flower-shows, fancy fêtes, &c. will throughout the season be held in the great central hall, nor will literary conversaziones and artistic gatherings be unknown. A reading and writing room is also to add to the comfort of visitors. Immediately above the aquaria, galleries, forty feet in width, extend all round the building. In these will be located the Picture and Fine-art exhibitions, and a Museum.

At present it is very difficult to judge of the appearance which the interior will ultimately present, but we are told fountains will play, flowers bloom on every side, and creeping-plants make the columns lovely. To the Picture and Fine art gallery, offers of the most generous contributions have been already received from the magnates and art-princes of the land.

Perhaps this short paper will be hardly complete without a word as to the financial aspects of the scheme. Shares are to be obtained at five pounds each—one pound to be paid on application, two pounds on allotment, and the balance in two payments of one pound each. Encouraged, no doubt, by the names of those who are at the head of the undertaking, the public have come forward with confidence and alacrity to take these shares.

A paper printed by the managers of the scheme, and to be obtained at the offices, Broadway Chambers, Westminster, gives, amongst other items, the rules for the election and privileges of Fellows or Members. We read there that 'the superficial feet of glass for the tanks will be just on two thousand feet. Perhaps the best idea of the massiveness of the work is to be gained by going underground.

Descending a ladder, you find yourself in a large tunnel, lofty enough for a wagon of hay to pass through. It is like an ancient Roman cloaca. The foundation of it is four feet of concrete; next above that, bricks; then Portland cement; then, next to the feet, asphalt. This last is used, because it has been found that salt water acts upon cement, and in time causes a leak. This cloaca is divided into three sections, one of which will contain fresh water; the others, salt; and the stream flowing from these tanks being constantly oxygenised, is kept in continual circulation. Through these means, the sea and fresh water will remain pure for years without change—indeed, the water at the Crystal Palace, Hamburg, and Paris has never been yet changed, though these aquaria have been in existence many years.'

Surely, every one must heartily wish every success to the Westminster Aquarium and Winter Garden. Truly, as was well said at the luncheon given some time ago by some of the members of the Council, if the Prince Consort had been spared to England till now, he would have entered heart and soul into an undertaking so calculated to further the amusement and intellectual improvement of the people.

#### 'RUBBISH.'

STRANGE as it may be to say so, those who pick up and utilise the rejected trifles are benefactors to society. Let this be a comfort to dustmen, scavengers, bone-grubbers, and rag-pickers; they are not mere pariahs and dirty outcasts. Dirty they must usually be, in person and in garments; but they work hard to obtain a living by means which are, generally speaking, honest. Not only do they find money's value among rubbish, but they prevent this rubbish from tainting the air by unchecked decay.

Let us instance the large dust-heaps which are to be seen in some of the outlying districts of the metropolis. The peripatetic dustmen call at the inhabited houses, and cart away the contents of the dust-bins or cellars. The medley of odds and ends is consigned to a heap in the dust-contractor's yard, where it undergoes a minute scrutiny; for no article worth a single farthing is allowed to pass unnoticed. The worst part of the affair is that this scrutiny is mainly done by women—women in unwomanly dirt doing unwomanly work. Men begin to work upon the heap by picking out and laying aside the larger kinds of miscellanies—such as old coal-scuttles and tin sauce-pans, old hats and bonnets, crinolines, &c. Then come the women, squatting down on the unsavoury heap, each with sieves and baskets around her. The old bottles and phials can be sold for use again; the glass can be remelted; the bones can be rendered productive of fat, marrow, gelatine, phosphorus, and made available for fertilising the soil; the old saucepans can have the tin and the solder removed from the sheet-iron; the old boots and shoes are sold to men who vamp them up in such a style that their former owners assuredly would not know them again; the rags

go to the paper-maker and the shoddy manufacturer; the house-cloths and dishcloths, redolent of grease, are eagerly bought by hop-growers as manure; the bits of bread are roughly cleaned, and not unfrequently eaten by the finders; the coal-dust and fine ashes are available for brick-burning; while bits of wood are useful for lighting fires. The contractor knows where to find a market for each and all of these dust-covered treasures.

The rag-bag is a special variety of dust-heap, with a more limited range of contents, and much greater value in a given weight. When a tailor has made a new coat, and a seamstress a new shirt, there are bits left too small to be useful for mending, and too valuable to be burnt or otherwise destroyed. And when that same coat and same shirt have been worn out in the fulfilment of their duty of clothing humanity, the fibres are still useful, if men can devise means of making them so. And men have devised means. As some time ago mentioned by us in treating of 'Waste Materials,' Yorkshire manufacturers have constructed shoddy machinery, by which woollen rags, new and old, can be torn up fibre from fibre, and mixed with new wool for spinning again into yarn, and weaving again into cloth. Those who laugh and sneer at shoddy are not quite justified in so doing; for it is now known that really warm and serviceable garments can be obtained from such materials, at moderate prices. The fault consists in passing off the product as if made wholly of new wool. The shoddy manufacturers of Dewsbury and Batley buy woollen rags from all parts of the world. London sends old stockings, white flannel, carpeting, serge, and cuttings of various kinds; Germany transmits its store of old knitted gray and white stockings; while the remains of old coats and gowns come in from all quarters. Very good samples are called *mungo*, those of inferior quality, *shoddy*—names that puzzle etymologists not a little. So excessively does the value vary, that the best kinds in scarce seasons have risen to as much as ten pounds per hundredweight, while the worst in plentiful seasons can scarcely command half as many shillings.

The linen contents of the rag-bag are still more eagerly appropriated than the woollen; for linen continues to be, as it has been for many centuries, the best material for making the best paper. It is from necessity rather than choice that the paper manufacturer makes large use of materials such as esparto-grass; rags are too few and too dear to supply his wants. The English rag-bag is quite insufficient for this purpose; so we import thousands of tons every year from foreign countries. It is a little curious that rags give some insight into the social habits of different nations; for wholesale buyers find that rags from Southern Europe are much more dirty, tattered, and discoloured than those from more northern countries—explain it how we may. Quite detailed is the classification which the dealer gives to his rags—

finest, seconds, blues, ducks, light fustians, light prints, thirds, black cottons, common sheeting; he appraises each and all, after grouping them. The 'finest' are the clean white linen or cotton shirts; the 'seconds' are soiled white garments, and the linings of women's dresses; the 'thirds' are corduroys, fustians, and printed cottons; 'new pieces' are the cuttings accumulated by shirt and collar makers and seamstresses, and the ends of cotton pieces; and so on.

The old-clothesman who comes to your house, and declares he will give a splendid price for any old hats, coats, boots, dresses, shawls, or other garments you may have to dispose of, would scorn to call himself a ragman; he buys garments to sell again, more or less doctored up; but still these garments come to the state of rags in the long-run, and are then consigned to the shoddy-mill and the pulp-vat; or, in the case of old boots and shoes, after being cobbled up till they will hold together no longer, they are ground to powder, pressed into a cake, and used for the inner soles of cheap boots. Another kind of itinerant is he who comes to your house with offers to buy old broken flint-glass, bottles, &c.; and he will willingly be a buyer of rags also. A third group of itinerants comprises the humblest of all, the veritable grubbers, who poke about in the gutters with a hooked stick, and hoist bones, rags, old metal, and what not into their bags.

There is one class of itinerants so interesting as to deserve special notice—the *Rag Brigade*, comprising poor boys who are trained to a humble but honest mode of earning a living. Some years ago, a Committee of the House of Commons, investigating the subject of the paper-duty, reported that 'not more than four-tenths of the rags of this country are preserved; if the remaining six-tenths could be returned to be manufactured, there would be no necessity to go to foreign markets for some twenty-five per cent. of the rags now required for the paper-manufacture of England.' This statement furnished a hint to the Ragged School Society. There had been established a *Shoe-black Brigade*: why not a *Rag-collecting Brigade*? Trucks were thereupon provided, and poor boys trained; the trucks were numbered, and the boys clothed in a serviceable uniform. A printed tariff was prepared, shewing how much money was to be offered for each kind of refuse. The *collectors* are the elder boys, who make purchases and manage the cash; the *assistants* are younger boys, to draw the trucks, and otherwise act under the collectors; while the *sorters* are employed at the warehouse or depot. Every truck has its round or beat, and returns in the evening with a collected store of odds and ends, honestly paid for in money. Paper, rags, old metal, glass, old ropes, bones—all are bought; and the boys have gone so far as to buy, and bring home to the superintendent, a cocked-hat, the trappings for a hearse, a bag with a million of cancelled postage-stamps, and other unexpected things.

The wardrobe-dealers and the marine-store dealers are not peripatetic; they keep shops. The former buy, not rags, but cast-off garments, which mostly go to clothe a humbler and still humbler grade of wearers, until reduced to veritable rags at last. The marine-store dealers buy all that the Rag Brigade buy, and more besides.

Paris exhibits all these phases as well as London,

with certain points of difference. Our Cloth Fair and Petticoat Lane are paralleled by the Parisian 'Halle aux Vieux Linges,' or Old Clothes Mart.

Whatever we may say of our own English rag-pickers and grubbers, those of Paris unquestionably take precedence, in number, organisation, and peculiarities. The *chiffonnier* of that capital is quite a character. With his *hotte* or square basket strapped to his back, his *crochet* or iron-pointed stick in one hand, and a lantern in the other, he goes forth at evenfall to grub up what Paris has thrown into the gutter; and Paris, we may observe, has the reputation of throwing much more out into the streets than is customary in the English metropolis. He pokes his *crochet* into the small heaps of rubbish, and quickly hooks up into his basket everything that by bare possibility may be worth a fraction of a farthing. Bits of paper, rags of woollen and cotton garments, bones, bits of bread, old iron and other metals—all go pell-mell into the *hotte*. He knows very well how to make a market of them. The paper is converted into *papier-mâché*; bits of scarlet cloth have the dye taken out of them, to make a stain for turnery and carvings; the other bits of woollen-ware are available to be ground up into flock for paper-hangings, and the cotton and linen rags for the paper-maker's pulp-vat; while the bones yield gelatine, bone-black, &c. The scraps of bread he may eat if he likes; but probably he sells them to M. Chapellier, who has established a singular trade—that of buying up stale bits of bread from all quarters, rebaking them, grinding them down, and selling them as bread-crumbs for use in diverse kinds of French cookery. The *chiffonnier* is a sort of gipsy, living apart from other social grades, and not dressing like them. He hates dogs, and dogs hate him, for they sometimes purloin from the rubbish-heaps titbits which he would fain appropriate to himself. Most of these men are too poor to work on their own account; they engage with master-*chiffonniers*, who provide them with squalid lodgings, and buy the contents of the baskets at stipulated rates. These masters undertake the frowzy work of separating the medley of odds and ends, parceling out the linen and woollen rags, paper, old metal, bones, &c., and finding a market for everything. The *chiffonniers* have their favourite *table-d'hôte*, where a *ragout* can be had for a few sous. They also have their club, where rules are laid down as to the round or beat for each man. A philanthropist, M. Vervier, has done much good, by inducing them to maintain a benefit society.

A rag-pickers' bull! Whoever could have imagined such a thing? And what people on earth would hold such an assembly, except the French? That Paris is not ignorant of such high jinks, has been shown so recently as the month of September. A correspondent of one of the London newspapers, strolling on a fine evening through a frowzy and poverty-stricken part of the city, espied a doorway with an illuminated inscription, *Bal*—a very Babel of tongues outside, and sounds of revelry within. Knowing he was near the low lodging-houses of the *chiffonniers*, he hazarded the safety of his person and pocket, and resolved to see what this *bal* meant. A small payment of six sous (threepence) not only obtained for him admission, but also the luxury of a *demi-litre bouteille* of Bordeaux wine—which of course he

was not obliged to drink unless he chose. Within the entrance was a long and narrow room, lined around the walls with deal tables and benches, at which *chiffonniers* of both sexes were quaffing their thin sour wine; some musicians were at the further end, while the rest of the room was kept clear for dancing. In full whirl and high enjoyment were the dancers. 'The women, miserably clad, and in many cases without shoes or stockings, moved about quietly enough; indeed, to any one unacquainted with a mode of motion peculiar to Frenchwomen, they might almost have seemed like witches exercising some spell over the movements of their victims; for men possessed of a thousand fiends could not have performed more delirious gyrations than some of their partners. One of them I noticed especially, a fierce-looking, unshaven fellow; with his cap planted at the back of his unkempt bushy head, his chin twisted sideways in the air, he put his arms and legs through a variety of the wildest movements, sometimes lifting his feet above his head, or tossing his arms about with the laxity of a disjointed acrobat, and all the while working his features into fiendish distortions, finishing with a series of elaborate pirouettes: all this is done in a moment, whilst crossing to his fair partner, and with the facility of a Grimaldi.' A belle of special attractions made her appearance after a time—tall, handsome, with lustrous brown eyes; wearing a blue bodice tied round the waist with a white cord, a red petticoat reaching to the knee, yellow stockings, pointed boots, and a white cap frilled at the edge; she was believed to have come from Savoy, but was not a *chiffonnier*. Every man wanted to dance with her.

The 'finds' in the rag-bag and the rubbish-heap are sometimes not a little curious. A mistress allows Betty the maid to keep a rag-bag; and occasionally Betty yields to the temptation of putting into that bag articles which are certainly not rags. But apart from any suspicion of dishonesty, valuables find themselves in very odd places, through inadvertency or forgetfulness. We need not say much about such small creatures as insects, spiders, or lizards, that are found by the paper-makers in bundles of esparto; they are unwelcome intrusions rather than finds. A patent lock was once found among the contents of a family rag-bag; and as it was worth five shillings, the buyer was well content. An old Latin Prayer-book, bought as waste paper, had a bundle of nails, curiously linked together, packed inside it. Half-sovereigns and other coins are found in cast-off pockets, in the heels of old stockings, and inside the linings of dresses. An old coat, purchased by a London dealer, revealed the fact—a joyful fact to the buyer—that the buttons consisted of sovereigns covered with cloth. Three pounds sterling, in German paper-money, found their way into a bundle of German rags that reached a paper-maker. The London Rag Brigade boys once found a bank cheque-book, and on another occasion six pairs of new silk stockings, in waste paper and rags which they had bought: these unexpected articles were, to the honour of the *Brigade*, at once returned. A rare find once occurred in the Houndsditch region. A dealer—of the gentle sex, we are told—gave sevenpence and a pint of beer for a pair of old breeches; while the bargain was being ratified at a public-house, the buyer began to rip up the

garment, when out rolled eleven golden guineas wrapped up in a thirty-pound bank-note. We rather think, that in strictness of law, the guineas of this treasure-trove belonged to the crown; but most likely the elated buyer and the mortified seller made merry over the windfall. Many people, in the days when banking was little understood, had a habit of concealing their spare money about their persons; thus, an old waistcoat, bought for a trifle, was found lined with bank-notes! But of all the finds, what shall we think of a *baby*? A paper-manufacturer assures us that in a bag of rags brought from Leghorn, and opened at an Edinburgh paper-mill, a tiny baby was found, pressed almost flat. Poor bantling! Was it accidentally squeezed to death in a turn-up bedstead, or was some darker tragedy associated with its brief history?

#### BRIDGING OVER GREAT INTERVALS OF TIME.

AN article on the above subject which recently appeared in this *Journal*, has excited some interest in an inhabitant of Plymouth, Massachusetts; he sends us the following:

'It may be thought wonderful that persons now living have conversed with an individual who could recollect a person born only about six years after the death of Queen Elizabeth. Yet, such is the fact, as will be immediately shewn. Mary Allerton, one of the Pilgrims who arrived by the *Mayflower* on our shores of New England in 1620, was born in 1609. She married Elder Thomas Cushman (the ancestor of the family of that name in America), and was the last survivor of that famous *Mayflower* company, dying in 1699, aged ninety. On the 22d of March 1694, one of her nearest neighbours gave birth to a son, who attained to the great age of nearly one hundred and eight years, dying December 8, 1801; living, as will be observed, in three different centuries. His name was Ebenezer Cobb; and he was in his day, and even unto the present time, known as "Grandpa' Cobb" by the people in this vicinity. Only two weeks ago, while on a visit to a venerable clergyman living two hundred miles away, and who was born here in 1786, I was entertained for a while by hearing him relate his personal recollections of this same Ebenezer Cobb, telling many stories concerning him, and describing his personal appearance just previous to his death. After he had finished, I asked him if he had ever realised that that life of over a century was the link that connected him with the founders of our nation. After I had given him the dates, he saw I was right, but added, that he "had never thought of it in that light before." Thus, should any one of the many young children who are now familiar with this aged gentleman, live to the same age as himself, they will be able to say, that it only required the lifetime of two individuals, previous to one they recollected, to "bridge over an interval" of more than three hundred and fifty years. It was rather a singular coincidence, that the very first magazine article I read after my return home was the one in your *Journal* referred to, and it prompted me to write you what I have.

'Another remarkable statement of facts can be made relating to the same subject. A person died in this vicinity in 1871, whose grandfather was

born during the reign of William and Mary (August 1694). His son, who was born December 23, 1729, was not married until he was nearly seventy years of age; and *his son*, who died in 1871, was not born until the year 1801. Probably other interesting facts could be learned of a similar nature, but these mentioned have been well known for many years.'

#### POLLY PARTAN.

A BALLAD, WRITTEN BY THE LATE DR ROBERT CHAMBERS IN 1821.

O PRETTY Polly Partan! she was a damsel gay,  
And, with a creel upon her back, she every night would stray  
To the market-cross of Edinburgh, where singing she  
would stand,  
While the gayest lords in Edinburgh ate oysters from her  
hand.

Oh! such a beauty Polly was, she dang the fish-wives a'—  
Her cheek was like the partan's back, her nose was like  
its claw!

Oh! how divinely did she look, when to her cheek there cam'  
The blushes that accompany the taking of a dram!

Her love he was a sailor, a sailor on the sea,  
And of a Greenland whaler the second-mate was he:  
But the Northern Sea now covers him beneath its icy wave,  
And the iceberg is the monument that lies upon his grave.

As pretty Polly Partan one night was going home,  
And thinking of Tam Hallibuck and happy days to come,  
Endeavouring to recollect if she was fou or not,  
And counting that night's profits in her kilted petticoat;

She had not gone a mile, a mile down the Newhaven road,  
When the spirit of Tam Hallibuck before poor Polly stood;  
The hiccup rose unheeded through her amazed throat,  
And the shilling dropt uncounted into her petticoat.

Oh, cold turned Polly Partan, but colder was the ghost,  
Who shivered in his shirt, as folks are apt to do in frost:  
And while from out his cheek he spat the phantom of a  
quid,

From the ghost of his tobacco-box he lifted off the lid.

'Oh! Polly,' cried the spirit, 'you may weep nae mair for  
me,

For my body it lies cauld and deep beneath the frozen  
sea;

Oh! will you be my bride, and go where sleeps your ain  
true lover,

The tangle-weed shall be your bed, the mighty waves its  
cover?'

'Oh, yes, I'll go!' cried Polly, 'for I can lo'e nane but  
you!'

And she turned into a spirit, and away with Tam she flew:  
And in her track, far to the north, a ghastly light there  
shone,

Her *coats* were like the comet's tail, her fish-creel like  
the moon.

And some folk about Buckhaven, that were lecturing that  
night

On th' aurora borealis and its beauties all so bright,  
Saw the spiritual lovers, with the lightning's quickest  
motion,

Shoot down among the streamers like two stars into the  
ocean.

## ADVENTURE AT MACAO.

It is the custom at Hong-kong, during the hot weather, to take a run to Macao, a Portuguese settlement on the coast of China. A steamer, belonging to an American firm, makes the voyage in about three hours; and what with the fine air and the suavity of the captain—a powerfully built man, known as Gentleman Connell—the voyage is particularly pleasant. Macao is almost an island, with a delightful broad drive between it and the mainland, and possesses a governor, chief-justice, and all the paraphernalia of a colony. Great Britain is, if anything, out of pocket with its colonies. It has to look after them to a certain extent, and gets nothing for doing so but the honour of the thing. The Dutch and Portuguese take a different view of these matters. They make a job of their colonies, making each not only pay its own expenses, but yield a certain revenue in cash to the mother country. To do this advantageously, all depends on the art of squeezing. The Dutch are reputedly good at that; but I am inclined to think that they scarcely come up to the Portuguese, one of whose objects is to get money out of their colonial dependencies.

The remittances from Macao to Portugal are looked upon as a legitimate revenue of the country, and as such receive notice in the annual budget. But how can Macao, a small port on the coast of China, with its trade pretty nearly gone, manage to succour the national exchequer? It does so by means of some profits out of the coolie traffic, and from its gambling-houses—neither of them very respectable, as sources to be drawn on by a European community; yet such is the fact. What we propose, is to give an idea of what is done by a manipulation of the gambling-house system.

The great game pursued by the Macanese is called *Yat, Ye, Sam, Se*—being the first four of the Chinese numerals, one, two, three, four. The counters employed are small copper coins, called *cash*, with a square hole in the centre. Near a pile of cash is a square metal plate, each side numbered—one, two, three, four. On any of these numbers the

gamblers deposit their stakes. When all is ready, the president banker takes a handful of cash from the heap, and setting it apart, draws the coins one by one towards him with an ivory stick, repeating aloud, as he does so, '*Yat, ye, sam, se*' ('One, two, three, four'), when whatever remains is the winning number. For instance, suppose that in his grasp he had picked up eighty-six; the fours divided into it would be twenty-one times and two remaining; consequently, two would be the winning number. Supposing you had staked a dollar, say on number two, an assistant of the banker would then hand the winner four dollars (the dollar staked, and three added), less seven per cent. discount upon the three dollars won, which discount he claims as his share. These houses are frequented by all classes—high and low, rich and poor, and cannot but be considered sources of demoralisation. I will not, however, discuss the moral aspect of the case, but proceed to my adventure.

It was in the heat of summer, the thermometer in-doors shewing as much as ninety-eight, that one Saturday afternoon I determined to leave Hong-kong behind me for a day or two, and take a trip to Macao. After a pleasant run, on the evening of our arrival at Macao, three of my friends and I, leaving our hotel, proceeded to one of the gambling establishments, more to satisfy our curiosity than anything else. We found the proprietor and all his staff, including the banker, shouting and gesticulating towards a not over-well-dressed Macanese. Upon inquiring the cause, we were told that the man had been playing, and had lost all his ready-money; and, moreover, had staked his watch, which he had also lost; when he then tendered his chain, and a few trinkets attached to it, at the same time naming a certain sum that he required for them. The amount was evidently too large, for the Chinaman would only give him one half of what he had asked; thereupon the Macanese became furious. One of my companions tried to reason with the man, and he at first appeared to listen with attention; but in a few minutes he turned the whole of his ire upon my friend. There are certain phrases in Chinese

denunciations which are used very freely amongst themselves, but which they are very careful not to use towards a foreigner, unless, indeed, they are mad, or drunk. On the present occasion, language was employed towards one of us that was altogether beyond endurance, and as no police-officer was at hand, the wretch paid the penalty of his rudeness by being instantly knocked down. I do not defend this violence. It might have been better to walk quietly and contemptuously away. Yet, the punishment was probably nothing more than the felloe expected, for he rose to his feet, and half apologised, and we thought no more about the matter. The house was quieted; the proprietor came and proffered us his thanks. We watched the game for a few minutes, and then left. In passing out, we noticed that our Macanese friend had left before us; but this did not surprise us. We made direct for our hotel, and passed down one or two streets, when, in turning a corner, we suddenly confronted a file of soldiers. We were called upon to halt, which we did; and then stepped forward our Macanese friend, and, before the sergeant, accused us of assaulting him.

We were ordered to fall in between the soldiers, and were then marched off to the guard-room. Arrived there, the charge was taken down, and we were politely asked our names and addresses, which we at once gave. We then asked to see some one in authority, and after waiting for about half an hour, one of the junior captains presented himself. We stated our case to him as clearly as possible; and Welby, one of the party, asked whether, provided we could find bail for our appearance on the morrow—Sunday—we could not return to our hotel. He replied in the affirmative, but added, that only one of us would be allowed to leave to try and obtain it, and that under escort, and that the bail must be a resident of, and not a visitor to the place. My friend who had actually committed the assault at once determined that he would go, and promised to be with us again in the course of half an hour.

We lit our cigars, and entered into conversation with the officer in charge of the guard, but that half-hour hung very heavily on our hands. We tried to look and appear cheerful, but were not very successful. In about three-quarters of an hour, our friend appeared with a gentleman of his acquaintance, whom he at once introduced to us as Mr Anderson, of a mercantile firm, whom he had fortunately met as he was making his way home. Welby at once explained how matters stood, and the unfortunate predicament in which he had placed us, who were then anxiously waiting his return. He laughed, and at once accompanied him back to our small prison. Having introduced himself to the captain, and explained who and what he was, he was readily admitted as our bail. We were then told that we would have to appear before the chief magistrate the next morning at eleven o'clock, which we promised to do. We left the place thankful to Mr Anderson in no

small degree for having released us from one of the dirtiest and most miserable guard-rooms it has ever been my lot to behold. Mr Anderson accompanied us a short way home, to take care of us, as he jocularly remarked, and then took leave of us for the night.

I for one felt anything but comfortable about the matter: we knew that the utmost punishment they would award us would be a simple fine: but it would not at all sound well to hear our Hong-kong friends talking about it, and indeed, might lead us into a little trouble. The next morning after breakfast our friend Mr Anderson kindly called to accompany us to the court. Upon entering the court, which was only a large room, with a long table in the centre surrounded by chairs, we found the chief of police alone, sitting at the table writing. He at once rose from his seat, shook hands with Mr Anderson, whom he evidently recognised, and with each of us. He at once entered into the case, and requested us to state exactly how the fracas occurred. Welby turned spokesman, and in rather a clever and humorous manner, detailed the whole circumstances; but particularly dwelling upon the grave insult he had received from our Macanese friend in his using the offensive expression. When he had finished, our chief of police at once addressed himself to our prosecutor, and in language not the politest in the world, told him that instead of his being the prosecutor he ought to have been the prisoner. 'How dare he,' he said, 'make use of such language to English gentlemen? Did he know who he was, and what they were? Would he attempt to insult His Excellency the governor? He might as well;' and much more to the same purpose, until the poor fellow actually trembled, and I really think that he imagined that he was the prisoner, and not we. The chief then drew us on one side, and told us that he thought the matter might be arranged between us without its going before the magistrate, and intimated that, as the prosecutor appeared to be not very well off, a present of a few dollars would be most acceptable to him. We gladly coincided with him, and thought ourselves lucky in getting off so cheaply. Welby at once went to the man, and was in the act of tendering him the money, when who should enter the room but the magistrate himself! The amicable arrangement was at once at an end, and we retired to our places round the table.

Whatever we might have thought of the chief's proceedings, and it was certainly with no small wonderment, the off-hand manner of hushing up a case was certainly placed in the shade by what followed afterwards from His Worship the magistrate. He politely requested us to be seated, and drawing from his pocket a cigar-case, took one, and then handed the case round to us. At the time it struck me as something superbly comical, that we as prisoners should be quietly sitting at the same table as the magistrate and chief of police, smoking our cigars, and that the prosecutor

should be left standing cowering, hat in hand, as if he were about to receive a sentence of penal servitude. After a hurried conversation between the two heads of departments, the magistrate, without reading out the charge, or even speaking a word to us, turned upon the prosecutor, and asked him what he had to say for himself. The man looked first at us, then at the magistrate, and back to us again in simple wonderment, that he, the prosecutor in a case of assault, should be standing cap in hand, whilst we, prisoners, should be seated at the magistrate's table, hats on, and cigar in mouth, and should be quietly called upon for an explanation. For a few moments he seemed as one that had lost the use of his tongue, and in fact he had done so; but all at once, he poured forth such a harangue in Portuguese, that it was now the magistrate's turn to look surprised at the daring impudence of the fellow. That he, a chief magistrate, and born in Portugal, should allow a fellow like this, a Macanese, half-Portuguese and half-Chinese, to address him in this manner; the thing was too much for him, and if he ever had the slightest sympathy with him, there was none now; no, not one atom. With a 'Silence, dog!' that sounded through the whole house, he whispered a few words to the chief of police, who rose, and noiselessly left the room. He then, addressing us, thanked us for our attendance, and apologised for the trouble and inconvenience to which we had been put, shook us each by the hand, and wished us good-morning. As we descended the stairs we met our friend the chief, and with him a sergeant and two rank-and-file. Pointing to the soldiers, we asked what they were for. 'Oh, to teach that dog up-stairs a lesson.' We had got off cheap ourselves, but how about the poor fellow up-stairs? I did not like the matter, and determined to see if I could not get him released. I half hinted as much to the chief, but he very promptly told me that I had far better leave matters alone; and seeing that it was no use further interfering, we took our departure.

On the way home I asked Mr Anderson for an explanation of the morning's proceedings, which he gave, if I remember right, in these words: 'You wonder, young men, at the extraordinary, polite manner in which you were treated this morning, and at that farce of a court of justice. But it is not always so. They can punish you there quite as severely as they can in Hong-kong, and very often do so. But in this case it was the only course that they could consistently pursue towards you. Money was at the bottom of it. The Portuguese home government have demanded this year a very much larger contribution from Macao than they are quite prepared to pay; and if this money is not forthcoming, His Excellency, who is so comfortably seated at Government House, will be quietly asked to resign. Now, their principal revenue is from the gambling-houses; these they farm out to one man, who again sublets them to others, who are the actual keepers of them. In the course of a month they will be put up to auction for the next year, and everything depends upon the amount the keepers make out of them, whether they will bring twenty-five per cent. under or over last year's price. If the houses get into bad repute, the Europeans will not frequent them; and if such a case as yours got wind, they would be deserted: the consequence would be that it

would be a case of twenty-five per cent. under, and not over. I have mentioned that the whole of these houses are farmed out to one man; would it surprise you to hear who that one is? I will tell you—the Chief of Police.'

## GLENCAIRN,

A DRAMATIC STORY IN THREE ACTS.

### THIRD ACT.

SITTING quietly at home in Edinburgh, and perusing the *Scotsman* newspaper, Mr Smith, member of the firm of Marshall and Sons, had his attention riveted on a paragraph descriptive of certain proceedings in New York concerning Jay Gould and a person styling himself the Right Hon. Lord Gordon. The circumstances narrated bore so close a resemblance to the transactions connected with Lord Glencairn, as to stimulate curiosity, and he resolved to procure, if possible, some details on the subject. In this there was little difficulty. Mr Smith happened to have a friend in New York, and to him he wrote for information respecting the appearance and character of Gordon; for if he were Glencairn who had fraudulently purchased a quantity of jewellery in Edinburgh, there might still be a possibility of getting payment sufficient to cover the loss.

In due time, a number of newspapers were received from New York, which left little doubt that Gordon was the missing Glencairn. To place the matter beyond dispute, it would have been satisfactory to procure a photograph of Gordon from New York; but such could not be supplied. In that city numerous attempts had been made to get Gordon photographed, without avail. His lordship was well aware that if his photograph were put in circulation, it might reach England, and bring down upon him a host of tradesmen whom he had succeeded in swindling. Keenly on the alert, he was able to baffle every effort to be photographed. New York artists in the photographic line do not stick upon trifles to accomplish their object. Denied access to his lordship, one of them planted his apparatus on the top of a house opposite his hotel, and watched an opportunity of taking a catch likeness of him when he appeared at any of the windows. All was in vain. Gordon took care never to keep his head steady for a single moment. He kept it so constantly shaking as to defeat the operator. An attempt was made to photograph him when under examination in court, but this also failed. When his lordship saw the apparatus planted within clear view of his countenance, he complained to the judge of the insult, and the persevering but disconcerted artist was forced to retire. On one occasion, a draughtsman, slyly peeping out from behind a person in the court, managed to take his likeness in pencil. The sketch, however, could not be called effective, and was of no practical service. As we write, this pencil sketch is on the table before us.

Although no photograph of Gordon could be

obtained from America, Mr Smith was fortunate in procuring a *carte de visite* of Glencairn from the office of the solicitor in London already mentioned, and this he transmitted to the attorneys employed by Gould in prosecuting Gordon, in New York. The *carte de visite* was received by the attorneys with a shout of delight. It at once shewed that Glencairn and Gordon were one and the same person. Gould could now incontestably prove that the person he had credulously intrusted with his property was a roving English impostor. To satisfy the ends of justice, all that was required was to procure the attendance of Smith in New York. Mr Smith, however, was in Scotland at the head of a large business concern, and a trip across the Atlantic, in order to be put in the witness-box, might neither be pleasant nor convenient. Still, he must be induced to come at all hazards. The expense of doing so not to be thought of. Smith, in fact, without knowing it, was now master of the situation.

Without anticipating any such summons, he received a telegram, beseeching him to come to New York on important business. All his expenses would be paid by Mr Gould. And he would be so good as intimate his departure, and the name of the steam-vessel in which he took his passage. Considering what he had endured from Glencairn's proceedings, and desirous of pursuing a quiet life, Smith naturally shrunk from the adventure; on the other hand, from the possibility of stopping the career of a man who had for years audaciously preyed on society, a strong sense of public duty overcame personal considerations. His partners in business did not quite relish the idea, but managing to overcome their scruples, he secured a berth in the mail-steamer *Batavia*, to sail from Liverpool on the 8th October 1872.

In a small book printed for private circulation, Mr Smith gives a graphic account of his voyage and subsequent excursions. He mentions that he was in a good ship, but the weather proved to be boisterous, and for several days he lay helpless in his berth, though in this respect he was not singular, 'only seven out of a hundred and fifty cabin passengers being able to appear in the state-room during the storm.' On the ninth day after leaving Liverpool, the vessel came in sight of Newfoundland; then, there was some trouble, if not danger, in sailing through the fogs, with the steam-whistle constantly sounding. No accident, however, happened, and the *Batavia* arrived safely at its destination on the morning of Sunday, October 20. The passengers were landed at New Jersey city, on the opposite side of the Hudson River from New York. A party, he says, was waiting his arrival with a carriage and pair, and he was driven—carriage, horses, and all—on to one of the ferry-boats, across to the city of New York. Now begin some experiences which he has modestly refrained from mentioning in his book.

In the brief space which had elapsed since

touching land, Mr Smith was unpleasantly made aware that his life was in danger, and that it would be necessary for him to exercise the greatest possible circumspection. A person would be constantly hovering round him to secure his personal safety. Partisans in the interest or direct employment of Gordon would not scruple to put him *hors de combat*. Not agreeable intelligence this for a peacefully disposed Scotsman, that assassins were on the watch to stab or shoot him, and that he must take care what he was about. Had he known of any such perils before leaving home, it is not the least likely that even under any sense of public duty he would have budged from the family fireside. However, here he was, and had to make the best of things.

The aspect of the lofty buildings, the crowded thoroughfares, and novelties of various kinds, helped to banish apprehensions of immediate danger. He was first driven to the Clarendon Hotel, where a splendid suite of rooms awaited him, and to which he was lifted by an elevator. The charge for the apartments was three pounds sterling a day; but no matter what it was, Mr Smith's bills were to be all paid by Gould. With the hints he had received, and while Gordon was in New York, Mr Smith, neither in this superb hotel nor in the Astor House, in which he was subsequently lodged, attended the *table-d'hôte*. He took all his meals in his own rooms, and by particular instruction did not chew himself in the passages. He usually kept the doors locked. This worthy individual, in fact, during much of the time he was in America, felt himself to be a kind of prisoner under an escort. The circumstance of having to exercise such extraordinary precautions gives one an impressive idea of the state of society in New York, where, as has been sometimes observed, life is less secure than it is in Naples or Constantinople.

Taken before the supreme court on the 30th October, Smith underwent a lengthened examination regarding Lord Glencairn and his transactions with him. His statements were clear and to the point. He verified the photograph of Glencairn, which he had furnished to the prosecution, and it was forthwith marked and bound up with the proceedings. Now lying before us, we cannot but view it as a testimony to the value of the photographic art in tracking out criminals, and bringing them to justice.\* The witness produced notes which he had received in the course of business from Glencairn, bearing the earl's coronet, the monogram H. G., and the signature H. Glencairn. These were also marked and put up along with the evidence. As an instance of his lordship's familiarity of intercourse and duplicity of character, he mentioned how cordially he spoke of Smith's eldest son, the lad of about twenty years

\* Copies of the photograph of Glencairn *alias* Gordon, bearing a *fac-simile* of his signature, may be procured from Mr John Horeburgh, photographer, 131 Princes Street, Edinburgh.

of age, to whom he had benevolently given his advices. 'I will tell you,' said his lordship, 'what transpired when I was your boy's age: at breakfast-time my father called me into his room, and said to me: "Hubert, you have now come to that time of life when you are going to enter the world; you know how bright your prospects are; deny yourself nothing; whatever your taste or inclination leads you to, gratify it; but never do anything you would not like me to know;" then his lordship addressing me: That is the advice I would give you regarding your boy.'

In these legal proceedings, Mr Smith gave some other assistance both in New York and Philadelphia, and all things concurred to shew that the person styling himself The Right Honourable Lord Gordon, was no other than the adventurer in high life who had figured in England and Scotland under the title of Lord Glencairn. Gordon foresaw that, if he abided his trial for getting securities and money on false pretences, he would be proved to be a swindler of the first magnitude, and committed to prison for probably several years; and that as Smith, the prime witness against him, could not intermediately be put out of the way, the best thing he could do would be to abscond, although in doing so a heavy loss would be suffered by those confiding individuals who had become his bail. Like a despicable and selfish coward, Gordon secretly went off, and after a long and dreary journey took refuge in Manitoba, a western province of Canada, on the shores of Lake Winnipeg, and adjoining the state of Minnesota, pertaining to the United States—the very heart of the North American continent.

Alas! poor wretch, like a hunted wild animal, he was now put to his last shifts. All his stories about his immense wealth, his vast heritable property, his titles to nobility, his lordly coronet and monogram, were at length, in the most humiliating circumstances, discovered to be a downright cheat. A terrible Nemesis was on his tracks. In the general economy of the world, it is observable, that even in momentous affairs, when some grand act of retributive justice is to be effected, matters go on in a very commonplace sort of way. We see no miraculous demonstration. All comes about under determinate and unerring Providential laws, which the evil-doer can no more evade than he can vanquish the laws of gravitation. Glencairn, *alias* Gordon, perhaps imagined himself to be safe from pursuit, within the distant Canadian border, with a great wild country beyond to fall back upon even to the fastnesses of the Rocky Mountains. If this was his notion, he was mistaken. How his remote retreat should have been discovered, is not within our knowledge, nor does it much signify. In the enormous diffusion of newspapers, letters passing through the post-office, and the electric telegraph, there were agencies sufficient to bring to light the very spot where he had taken refuge, although situated thirteen hundred miles west of New York.

Not by the vigilance of the criminal law was he traced, but by a person named Roberts, who (probably on behalf of others) had become bail for his appearance. Unfortunately, he did not go to work regularly. Gordon was within British territory, and could only be legally captured by the warrant of a British magistrate. Instead of adopting this means of securing him, he procured a warrant from a United States magistrate, under which irregular process, two officers, one of them named Hay, crossed the frontier, and seized their unhappy victim. According to international law, this was undoubtedly an error; but it appears to have been sanctioned as not illegal by Wilson, a United States lawyer, on the ground that bailsmen could anywhere, and in any way, take the person for whom they were bound. A Manitoba newspaper, dating from Fort Garry, July 7, 1873, gives an account of the affair:

'The arrest of the so-called Lord Gordon, of Erie notoriety, is likely to lead to an international complication. Two Minneapolis detectives, acting under the authority of Mr Brackett, Mayor of Minneapolis, and the advice of the principal lawyers of that city, arrived at Winnipeg on the 2d July, obtained a conveyance, and seized Gordon at a friend's house, five miles from town, and drove through Winnipeg toward Pembina on the frontier. The friends of Gordon discovered the arrest, and telegraphed to Pembina to capture the Americans as kidnappers. The parties were brought back and lodged in jail. One or two residents were also arrested as accessories.' Next day, Brackett, the Mayor of Minneapolis, arrived with a view to assist the prisoners; but as instigator of the proceedings, he was arrested also. A day or two later, Gordon was examined in court regarding his arrest. 'He testified that while overseeing some work done on his property at Fort Garry he was approached by the prisoners, who said they were Minneapolis officers, and had a warrant for his apprehension. He denied their authority to remove him, on a mere warrant issued by a Minnesota official, from the Dominion of Canada, and refused to go with them. He was then overpowered, ironed, and placed in an ambulance, and driven forcibly toward the United States' line, when he was relieved by the police of Manitoba.'

The seizure of Gordon in the irregular manner mentioned, caused a great commotion in Manitoba, and a serious judicial inquiry ensued, along with lengthened discussions and comments in the newspapers. We content ourselves by copying an explanation of the alleged outrage, issued by J. W. Taylor, United States consul in Manitoba, which throws some light on the subject: 'Gordon was arrested in New York for embezzlement. Roberts released him from prison by becoming his bail for thirty-seven thousand five hundred dollars. Gordon ran away to Manitoba. As the bond was about to become forfeited, Roberts procures proper exemplifications of the bail-piece, and executes a power of

attorney to Hay, authorising him to act. Hay, with this authority, goes with an assistant to Manitoba, and makes the arrest by common law. A bail has the right to take his principal wherever and whenever he can find him. When a prisoner is released from prison, he is considered in the continual custody of his bail. This right is not controlled by state or national boundaries, but runs wherever the common law exists, if the right has not been taken away by statute treaties, and extractions of laws have nothing to do with the question. They relate to delivery for crimes. (Gordon is not sought on account of embezzlement, but to relieve Roberts of his liability. There is no process, no international arrangement by which Roberts can obtain him. No governmental demand can be legally made or responded to for the purpose of restoring Gordon to his bail. Roberts must take him by his common law right. What Roberts can do, his duly authorised agent can do. The taking of Gordon by Hay was no violation of law. The common law right exists in Manitoba, uncontrolled by any statute. It has been frequently ruled in the United States that the bail had the right to come from one state into another to take his principal. The jurisdictions of the different states are as distinct as those of New York and Manitoba, and they are vested wholly on the common law principle, equally in force here as there. With this exposition, I submit that the gravity of the question involved, as well as the interests of both countries, required that all testimony which the defence is prepared to shew should be admitted, and as an act of international courtesy, that Mr Wilson may be heard during the present examination. I think it not inappropriate for me to add that from an examination and knowledge of all the facts, it will appear that there was no intention on the part of any one to violate the international law or to insult this government, but that every one connected with it sincerely believed that he was acting in accordance with his legal right.

A plausible explanation this; but it did not satisfy the court which had the matter under consideration. There had been an unjustifiable outrage on international rights. We cannot go into a formal history of the embroilment. The end of it was that Brackett, the mayor of Minneapolis, was released, and the two United States officers were tried and imprisoned for their offence. Gordon continued at liberty to go where he liked. He did not long remain at Fort Garry, but disappeared, no one could exactly say where. There were all sorts of rumours; one of them, that he had gone across the prairies towards the Rocky Mountains; another that he had proceeded in the direction of Toronto and Montreal. It is uncertain where he was, or how he was squandering his money. One fact is indisputable; he again cast up in Manitoba in the summer of 1874, and took up his residence at a place called Headingley. Like the moth fluttering round the candle, he might

almost be said to court destruction. It came swiftly.

Meanwhile, what of Thomas Smith of Marshall and Sons? On the disappearance of Gordon from New York, in 1872, Mr Smith made a short tour by way of Albany and the Falls of Niagara to Toronto, accompanied by two conductors or guardians, who had hopes of hearing something of the fugitive at the different places visited. Nothing, however, could be heard of him; and his two companions, in their capacity of detectives, proposed to extend the journey to Montreal. To this, Smith demurred. He had spent a fortnight in America; it was not his business to go hunting for Gordon up and down the country; he had affairs to look after at home; if the detectives pleased, they might pursue the search at Montreal, or anywhere else in Canada, but he must return to Scotland. As a compromise, he went before a police magistrate at Toronto, and procured a warrant for the apprehension of Gordon on a charge of swindling the firm he represented. Leaving the warrant behind him, he now returned home, taking his passage in the steamer *Java* from New York, and arriving at Liverpool on the 17th November.

The investigations of the detectives were not immediately successful; and only by a fresh impulse communicated by New York lawyers, was Smith's warrant made practically available in 1874. On the 1st August of that year, Gordon was arrested at Headingley in Manitoba. The story of his capture is almost too painful to be told, but the strange narrative would be incomplete without it. We gather particulars from the deposition of Alexander Munro, a Toronto police-officer who executed the arrest.

Arriving at the house in which Gordon was residing, and introduced to his presence, 'I told him,' says Munro, 'that I had come to arrest him, and that I had a warrant. He asked if it was another case of kidnapping, and I said it was not, but everything regular, and I shewed him the warrant. He said it was all right, and just glancing at it, professed himself ready to go. Only, he wished to be allowed to put on warmer clothes. He got dressed, and was all ready to go, with the exception of a Scotch cap, which he wished to get from the bedroom. I closely followed him. On entering the bedroom, he laid hold of a loaded pistol, and declaring that he would not move a step further, he put the pistol to his head. I made a rush to prevent his shooting, but it was too late. He pulled the trigger, and shot himself through the head. He sank down and died almost immediately.'

So there was the finish of one of the most extraordinary impostors of our time. A coroner's inquest was held on the body, the verdict being, that Gordon, while labouring under the excitement arising from his arrest, had shot himself with a pistol, causing death. It appeared from inquiries that he had been in the habit of giving away

jewellery, and had little left. Even his money had been spent, for on searching his pockets there was found only the sum of thirty-seven cents—eighteenpence-halfpenny! That was apparently all he possessed out of his enormous ill-gotten gains! Whether, since his decease, Gould has succeeded in recovering the securities about which he carried on a litigation against Gordon, is not known to us.

In none of the printed proceedings or elsewhere, is there a scrap of intelligence concerning the real name, or the relatives of this remarkable person. No one seems to know who or what he was, who were his parents, or where he was born. He altogether remains a mystery. It would be curious to know if any one lamented his wrecked opportunities of well-doing, or mourned his deplorable fate. At times he spoke of his mother being a gay lady, but that she and his father were dead. He likewise said he had been educated at Cambridge, which is not improbable. From occasional hints in his conversation, his Christian name was Hubert, though on that there can be placed no dependence. His assumption of nobility was proved to have no warrant in fact. By those who had the misfortune to have dealings with him, his manner is described as having been charming and faultless. Nor can it be said he was all bad. There were good points in his character. He was generous in his distribution of charity, and we are told that, while figuring as Lord Glencairn in Forfarshire, he tenderly and with assiduity nursed a gentleman, his neighbour, through a serious illness. On all hands it is admitted that he possessed talents which, if put to a good use, could scarcely have failed to raise him to honourable distinction. As an explanation of his depravity, it is alleged that he had formed intimacies with, and been demoralised by, that extensive class of gamblers, fraudulent speculators, and dishonest projectors of foreign loans, who have latterly brought discredit on the higher departments of London society into which, strangely enough, they have gained admission.

There might perhaps be another version of Gordon's depravity. We hear of no confederate in his swindling transactions. Apparently an isolated individual, he relied on his own peculiar strategy. This would almost lead to the impression that he was to a degree mad. Lunatics, it is known, do not combine. They act independently, each from his own deranged fancies. At anyrate, there was something maniacal in Gordon. He had a mania for stealing and swindling, but he had equally a mania for lavishly giving away that which he so fraudulently acquired. In short, his perversities might have been as much matter for medical as for judicial inquiry. The last fatal act of this inconprehensible being demonstrated an acute sense of what he had brought himself to by his ingeniously contrived rogueries. Unable to brook the ignominy of being paraded as a convict, stripped of his ridiculous and

long sustained pretensions to rank, he forthwith unpreparedly rushed to his last account, and while still a young man sunk into an unhonoured grave. We leave every one to apply the moral that may be readily drawn from such an extraordinary career, and the melancholy catastrophe by which it was so abruptly terminated.

In concluding our tragi-comic drama of real life, it would be improper not to say that Mr Smith, who had unwillingly been brought so prominently forward, looks back on the affair with anything but agreeable emotions. Considering the trouble and vexation he experienced, he might well say with BURNS, though in a very different spirit—

But I'll remember thee, GLENCAIRN,  
And a' that thou hast done for me.

W. C.

## THE FLAG OF DISTRESS.

### CHAPTER XLIII.—THE BARQUE ABANDONED.

SIMULTANEOUS with the abduction on deck, there is a scene in the *Coudor's* cabin that might be likened to a saturnalia of demons.

The skipper and Don Gregorio, sitting over their walnuts and wine, are startled by the sound of footsteps descending the stair; these heavy and hurried, bearing no resemblance to the gentle tread of women. It cannot be the ladies coming down again. Nor yet the negro cook, since his voice is heard above in angry expostulation; for two of the sailors have seized him in his galley, throttled him back on the bench, and are there lashing him with a piece of log-line.

They at the cabin table know nothing of this. They hear his shouts, with the shrieks of the ladies; but have no time to seek explanation, as at that instant the door is dashed open, and several sailors burst in; the second-mate at their head. Lantanas, facing the door, sees them first; Don Gregorio, turning in his seat, the instant after. Neither thinks of demanding a reason for the rude intrusion. The determined air of the intruders, with the fierce reckless expression on their faces, tells it would be idle.

In a time shorter than it takes to tell it, the two doomed men are made fast to the stanchioned chairs, where they sit bolt upright, firm as bollard heads, though not in silence. Both utter threats, oaths, angry fulminations. Not long are they allowed even freedom of speech. One of the sailors thrusts something between Captain Lantanas' teeth, gagging him. Another, ready prepared for remonstrance, does the like for Don Gregorio. Then the work of pillage proceeds. The locker lids are forced, and the boxes of gold-dust dragged out. Several comings and goings are required for its transport to the pinnace; but at length it is stowed in the boat, the plunderers taking their seats beside it. One lingers in the cabin behind the rest; that fiend in human shape who has all along counselled killing the unfortunate men.

Left alone with them—they helpless and at his mercy, he looks as if still determined to do this. It is not from any motive of compassion that he goes from one to the other, and strikes the gags from between their teeth. For at the same time he apostrophises them in horrid mockery :

'*Carramba !* I can't think of leaving two gentlemen seated at such a well-furnished table, without being able to hob-nob and converse with one another.' Specially addressing Lantanas, he continues : 'You see, captain, I'm not spiteful ; else I shouldn't think of shewing you this bit of civility, after the insults you've offered me, since I've been second-officer of your ship.' Then approaching Don Gregorio angrily, he shrieks into his ears : 'Perhaps you don't remember me, Montijo. But I do you. Can your worship recall a circumstance that occurred some six years ago, when you were *alcalde-mayor* of Yerba Buena ? You may remember having a poor fellow pilloried and whipped, for doing a bit of contraband. I was that unfortunate individual. And this is my satisfaction for the indignity you put upon me. Keep your seats, gentlemen ! Drink your wine, and eat your walnuts. Before you've cleared the table, this fine barque, with your noble selves, will be at the bottom of the sea.' The ruffian concludes with a peal of scornful laughter, continued as he ascends the cabin stair, after striding out and clanging the door behind him.

On deck, he finds himself alone ; and hurrying to the ship's waist, scrambles over the side, down into the pinnace ; where he finds everything stowed, the oarsmen seated on the thwarts, their oars in the rowlocks, ready to shove off. They are not all there yet. The first-mate and Davis are still aboard the vessel.

There are those who would gladly cast loose and leave the laggards behind. Soon as stepping into the boat Padilla proposes it, the other Spaniards abetting him. But their traitorous desire is opposed by Striker. However otherwise debased, the ex-convict is true to the men who speak his own tongue. He protests in strong determined language, and is backed by the Dutchman, Dane, and La Crosse, as also Tarry and Slush.

'Bah !' exclaims Padilla, seeing himself in the minority ; 'I was only jesting. Of course, I had no intention to abandon them. Ha, ha, ha !' he adds with a forced laugh, 'we'd be the blackest of traitors to behave that way.'

Striker pays no heed to the hypocritical speech, but calls to his fellow-convict and Harry Blew, alternately pronouncing their names. He at length gets response, and soon after sees Davis above, clambering over the rail. Blew is not far off, but still does not appear. He is by the foot of the mainmast with a haulyard in his hands, as though hoisting something aloft. The moon has become clouded, and it is too dark for any one to see what it is.

'Hillo, there, Blew !' again hails Striker ; 'what be a-keepin' ye ? Hurry down ! These Spanish chaps are threetnin' to go off without ye.'

'Hang it !' exclaims the chief-mate, now shewing at the side ; 'I hope that an't true !'

'Certainly not !' exclaims Padilla ; 'nothing of the kind. We were only afraid you might delay too long, and be in danger of going down with the vessel.'

'Not much fear o' that,' returns Blew, dropping with Davis into the boat. 'It'll be some time afore she sinks. Ye fixed the rudder for her to run out, didn't ye ?'

'Ay, ay !' responds he who was last at the wheel.

'All right ; shove off, then ! That wind 'll take the old *Condor* straight seaward ; an' long afore sunrise, she'll be out sight o' land. Give way there—way !'

The oars dip and plash. The boat separates from the side, with prow turned shoreward. The barque, with all sail still spread, is left to herself, and the breeze, which wafts her gently away towards the wide wilderness of ocean.

Proceeding cautiously, guarding against the rattle of an oar in its rowlock, the pirates run their boat through the breakers, and approach the shore. Ahead they see the two summits, with the moon just going down between them.

The shore outline is a cove of horse-shoe shape, the cliffs extending around it. With a few more strokes the boat is brought into it, and glides on to its innermost end.

As the keel grates upon its shingly strand, their ears are saluted by a chorus of cries.—the alarm signal of sea-birds, startled by the intrusion. Some fly up from the beach, others from ledges along the cliff's face. The scream of the sea-eagle can be distinguished like the laugh of a maniac. These sounds, notwithstanding their discordance, are sweet to those now hearing them. They tell of a shore uninhabited—literally, that the 'coast is clear'—just as desired. Beaching their boat, the pirates spring on shore, and lift the captives out ; then their spoils ; one unresisting as the other. Some go in search of a place where they may pass the night ; for it is too late to think of moving inland. Between the strand and the cliff's base, they discover a place, several feet above sea-level, having an area of over an acre, covered with coarse grass ; just the spot for camping-ground. As the sky has become clouded, and threatens a down-pour of rain, they carry thither the boat's sail, intending to rig it up as an awning. But a discovery is made which spares them the trouble. Along its base, the cliff is honeycombed with caves, one of ample dimensions, sufficient to shelter the whole crew. A ship's lamp, which they have brought with them, when lighted, throws its glare upon stalactites, that sparkle like the pendants of chandeliers. Disposing themselves in various attitudes, some reclined on their spread pilot-coats, some seated on stones or canvas bags, they enter upon a debauch with the wine abstracted from the cabin stores of the abandoned barque—drinking, talking, singing, and shouting, till the cavern rings with their rude revelry. It is well their captives are not compelled to take part in it. To them has been appropriated one of the smaller grottoes, the boat-sail fixed in front, securing them privacy. Harry Blew has done this. In the breast of the British man-o'-war's man there is still a spark of delicacy. Though his gratitude has given way to the greed of gold, he has not yet sunk to the low level of ruffianism around him.

While the carousal is thus carried on within the cave, without, the overcast sky begins to discharge itself. Lightning forks and flashes athwart the firmament ; thunder rolls reverberating along the

cliffs; a strong wind sweeps them; and rain rushes down in torrents.

It is a tropic storm—short-lived, lasting scarce an hour; but, while on, it lashes the sea into fury, driving the breakers upon the beach, where the boat has been left loosely moored. In the reflux of the ebbing tide, it is set afloat and carried away seaward. Coming upon the coral reef, it bilges, is broken to pieces, and the fragments as waifs dance about and drift far away over the foam-crested billows.

#### CHAPTER XLIV.—TWO TARQUINS.

It is an hour after midnight. A calm has succeeded the storm; and silence reigns around the cove where the pirates have put in. The sea-birds have returned to their perches on the cliff, and now sit noiselessly, save an occasional angry scream from the osprey, as a whip-poor-will, or some other plumed plunderer of the night, flits past his place of repose, near enough to wake the tyrant of the sea-shore, and excite his jealous rage. Other sounds are the dull boom of the outside breakers, and the lighter ripple of the tidal waves washing over a strand rich in shells, and coral worn by attrition into a thousand shapes. Now and then, a *manatee*, raising its bristled snout above the surf, gives out a low, prolonged wail, like the cry of some creature in mortal agony. It might be mistaken for the moan of a human being, whose spirit is sorely oppressed.

But there is no human voice now. The ruffians have ended their carousal. Their profane songs, ribald jests, and drunken cachinnations, inharmoniously mingling with the soft monotone of the sea, have ceased to be heard. They lie astretch along the cavern floor, its hollow aisles echoing back only their snores and stertorous breathing.

But they are not all asleep, nor all inside the cavern. Two are outside, seen making approach towards the grotto occupied by the captive girls. As the moon has gone down, it is too dark to distinguish their faces. Still, there is light enough reflected from the luminous surface of the sea to shew that neither is in sailor garb, but in the habiliments of landmen—this the national costume of Spanish California. On their heads are *sombreros* of ample brim; on their legs trousers, open-seamed, flapping loose around their ankles; while over their shoulders they carry cloaks, which, by their peculiar drape, are recognisable as *mangas* of Mexico.

In the obscurity, the colour cannot be determined; but one is scarlet, the other sky blue. As dressed now, it would be difficult to identify these men as Gomez and Hernandez. Yet, it is they.

They are approaching the grotto without any show of fear, or even caution; slowly, and in conversation. Gomez has commenced it, saying:

'I've been thinking, *companionero*, now we've got everything straight so far, that our best plan will be to stay where we are till it's all fixed as we want it. We can send on for the *padre*, and bring him here; or failing him, the *cura*. To tell truth, I haven't the slightest idea of where we've come ashore. We may be a goodish distance from Santiago; and to go there, embargued as we are, there's a possibility of our being robbed of our pretty baggage on the route. You understand me?'

'Si—ciertamente!'

'Against risk of that kind, it is necessary we should take some precautions. And the first—as also the best I can think of—is to stay here, till we're spliced to our sweethearts. Rafael can act as a messenger; or, for that matter, Don Manuel. Either, with six words I shall intrust to him, will be certain to bring back an ecclesiastic, having full powers to go through the form of a ceremony. Then we can march inland without fear—ay, with flying colours; both Benedicts, our blushing brides on our arms. In Santiago de Veragua we shall spend our honeymoon.'

'Delightful anticipation!'

'Just so. And for that very reason, we mustn't risk marring it; which we might, by travelling as simple bachelors. So I say, let us get married before going a step farther.'

'But the others? Are they to assist at our nuptials?'

'Certainly not.'

'In what way is it to be avoided?'

'The simplest in the world. It's understood that we divide our plunder the first thing in the morning. When that's done, and each has stowed away his share, I intend proposing that we separate; every one to go his own gait.'

'Will they agree to that, think you?'

'Of course they will. Why shouldn't they? It's the safest way for all, and they'll see it. Twelve of us trooping together through the country—to say nothing of having the women along—the story we're to tell about shipwreck might get discredited. When that's made clear to our old shipmates, they'll be considerate for their own safety. Trust me for making it clear. Of course we'll keep Padilla and Velarde to act as grooms-men; so that the only things wanted will be a brace of bridesmaids.'

'Ha, ha, ha!' laughs Hernandez.

'And now to see about our brides. We've not yet proposed to them. We went once to do that, and were disappointed. No danger now.'

'I suppose we may count upon a flat refusal.'

'Flat or sharp, little care I; and it won't signify, one way or the other. In three days, or less, I intend calling Carmen Montijo my wife. But come on! I long to lay hand and heart at her feet.'

Saying which, Gomez strides on towards the grotto, the other after, like two Tarquins about to invade the sleep of innocence.

Though the cave is in darkness, its occupants are not asleep. To them repose is impossible. They are experiencing the keenest anguish possible to human heart. They have passed through its first throes, and are for the time calmer. But it is the tranquillity of despair, of deep deadening grief. They mourn him dearest to them dead. They have no doubt that he is so. How could they? While in the boat, they heard their captors speak about the scuttling of the ship, well knowing what was meant. Long since has she gone to the bottom of the sea, with the living, or perhaps only their lifeless bodies; for they may have been murdered before being abandoned. No matter now in what way death came to them. Enough of sadness and horror to think it has come, without speculating on details—enough for the bereaved ones to know they are bereft. Nor do they need telling why it has all been done. Though hindered from seeing while in the boat, they have heard.

Cupidity: the cause of the crime, resulting in a conspiracy, a scheme to plunder the ship. Alas, it has succeeded!

But all is not yet over. Would that it were! There is something still to come; something they fear to reflect upon, much more speak of to one another. What is to be their own fate? They can neither tell nor guess. In their affliction, their thoughts are too distracted for calm or clear reasoning. But in the midst of vague visions, one assumes a shape too well defined, with darkest shadows filling up the outline. It is the same of which Carmen was speaking when seized. She again returns to it, saying: 'Inez, I'm now almost sure we are not in the hands of strangers. What has happened, and those voices we heard, tell me my suspicions have been correct.'

'Heaven help us, if it be so!'

'Yes; Heaven help us! Even from pirates we might have expected some mercy; but none from them. *Ay de mí!* what will become of us?'

The interrogatory is only answered by a sigh. The proud spirit of the Andalusian girl, habitually cheerful, is now crushed by a weight of wretchedness enough to steep it in despair. After a time they again exchange speech, seeking counsel of one another. Is there no hope, no hand to help, no one to whom they may turn in this hour of dread ordeal?

No—not one! Even the English sailor, in whom they had trusted, has proved untrue; to all appearance, from what they have seen and heard, chief of the traitorous crew! Every human being seems to have abandoned them. Has God?

'Let us pray to Him!' says Carmen.

'Yes,' answers Inez; 'He only can help us now.'

They kneel side by side on the hard, cold floor of the cavern, and send up their voices in earnest prayer. They first entreat the Holy Virgin that the life of him dear to them may yet be spared; then invoke her protection for themselves, against a danger both dread more than death itself. They pray in trembling accents, but with a fervour eloquent through fear. Solemnly pronouncing 'Amen!' they make the sign of the cross. As their hands drop down from the gesture, and while they are still in a kneeling attitude, a noise outside succeeds their appeal to Heaven, suddenly recalling them to earthly thoughts and fears.

They hear voices of men in conversation; at the same time the sail-cloth is pushed aside, and two men press past it into the cave. Soon as entering, one says: 'Señoritas! We must ask pardon for making our somewhat untimely call, which present circumstances render imperative. It's to be hoped, however, you won't stand upon such stiff ceremony with us, as when we had the honour of last paying our respects to you.'

After this singular peroration, the speaker pauses to see what may be the effect of his words. As this cannot be gathered from any reply—since none is vouchsafed—he continues: 'Doña Carmen Montijo, you and I are old acquaintances; though, it may be, you do not remember my voice. With the sound of the sea so long echoing in your ears, it's not strange you should not. Perhaps the sense of sight will prove more effectual in recalling an old friend. Let me give you something to assist it.'

Saying this, he holds out a lantern, hitherto concealed beneath his cloak. As it lights up the grotto, four figures are seen erect; for the girls have sprung to their feet in apprehension of immediate danger. Upon all, the light shines clear; and, fronting her, Carmen Montijo sees—too surely recognising it—the face of Francisco de Lara; while in her *vis-à-vis*, Inez Alvarez beholds Faustino Calderon!

Yes; before them are their scorned suitors; no longer disguised in sailor garb, but resplendent in their Californian costume—the same worn by them on that day of their degradation, when De Lara rolled in the dust of the Dolores road.

Now that he has them in his power, his triumph is complete; and in strains of exultation he continues: 'So, ladies! we have come together again. No doubt you're a little surprised at our presence, but I hope not annoyed.'

There is no reply to his taunting speech.

'Well; if you won't answer, I shall take it for granted you are annoyed; besides looking a little alarmed too. You've no need to be that.'

'No, indeed,' endorses Calderon. 'We mean you no harm—none whatever.'

'On the contrary,' goes on De Lara; 'only good. We've nothing but favours to offer you.'

'Don Francisco de Lara,' says Carmen, at length breaking silence, and speaking in a tone of piteous expostulation; 'and you, Don Faustino Calderon! why have you committed this crime? What injury have we ever done you?'

'Come! not so fast, fair Carmen. Crime's a harsh word, and we've not committed any as yet—nothing to speak of.'

'No crime! *Santissima!* My father—my poor father!'

'Don't be uneasy about him. He's safe enough.'

'Safe! Dead! Drowned!'

'No, no. That's all nonsense,' protests the fiend, adding falsehood to his sin of deeper dye. 'Don Gregorio is not where you say. Instead of being at the sea's bottom, he's sailing upon its surface; and is likely to be, for no one knows how long. But, let's drop that subject of the past, which seems unpleasant to you, and talk of the present—of ourselves. You ask what injury you've ever done us. Faustino Calderon may answer for himself to the fair Inez. To you, Doña Carmen, I shall make reply— But we may as well confer privately.'

At this, he lays hold of her wrist, and leads her aside; Calderon conducting Inez in the opposite direction.

When the whole length of the cavern is between the two pairs, De Lara resumes speech.

'Yes, Doña Carmen; you have done me an injury—a double wrong, I may call it.'

'How, sir?' she asks, releasing her hand from his, and flinging him off with a disdainful gesture.

'How?' he retorts. 'Why, in making me love you; by leading me to believe my love returned.'

'You speak falsely; I never did so.'

'You did, Doña Carmen; you did. It is you who speak false, denying it. That is the first wrong I have to reproach you with. The second is in casting me off, as soon as you supposed you'd done with me. Not so, as you see now. We're together again—never more to part till I've had satisfaction for every injury received at your hands. I once hinted, and now tell you

plainly, you've made a mistake in trifling with Francisco de Lara.'

'I never trifled with you, señor. What means this? Man—if you be a man—have mercy! Oh! what would you—what would you?'

'Nothing to call for such distracted entreaty. On the contrary, I've brought you here—for I'll not deny that it's I who have done it—to grant you favours, instead of asking them—or even satisfying resentments. What I intend towards you, I hope you'll appreciate. To shorten explanations—for which we've neither opportunity nor time—I want you for my wife—want you, and will have you.'

'Your wife!'

'Yes; my wife. You needn't look surprise, nor counterfeit feeling it. And equally idle for you to make opposition. I've determined upon it. Señorita! you must marry me.'

'Marry the murderer of my father! Sooner than do that, you shall also be mine. Wretch! I am in your power. You can kill me now.'

'I know all that, without your telling me. But I don't intend killing you. On the contrary, I shall take care to keep you alive, until I've tried what sort of a wife you'll make. Should you prove a good one, and fairly affectionate, we two may lead a happy life together; notwithstanding the little unpleasantness that's been between us. If not, and our wedded bondage prove uncongenial, why, then, I may release you in the way you wish, or any other that seems suitable. After the honeymoon, you shall have your choice. Now, Doña Carmen! those are my conditions. I hope you find them fair enough?'

She makes no reply. The proud girl is dumb, partly with indignation, partly from the knowledge that all speech would be idle. But while angry to the utmost, she is also afraid—trembling at the alternative presented—death or dishonour; the last if she marry the murderer of her father; the first if she refuse him!

The ruffian repeats his proposal, in the same cynical strain, concluding it with a threat.

She is at length stung to reply; which she does in but two words, twice repeated in wild despairing accent. 'They are, 'Kill me—kill me!'

Almost at the same time does Iñez answer her cowardly suitor, who in a corner of the grotto has alike brought her to bay.

After the dual response, there is a short interval of silence. Then De Lara, speaking for both, says:

'Señoritas! we shall leave you now; you can go to sleep without fear of further solicitation. No doubt, after a night's rest, you'll awake to a more sensible view of matters in general, and the case as it stands. Of one thing be assured: that there's no chance of your escaping from your present captivity, unless by consenting to change your names. And if you don't consent, they'll be changed all the same. Yes, Carmen Montijo, before another week passes over your head, you shall be addressed as Doña Carmen de Lara.'

'And you, Iñez Alvarez, will be called Doña Iñez Calderon. No need for you to feel dishonoured by a name among the best in California—noble as your own; ay, or any in Spain.'

'Hasta mañana, muchachas!' salutes De Lara. 'Pasan Vos buena noche!' (Till morning, ladies: good-night!)

Calderon repeating the same formulary of speech, the two step towards the entrance, lift up the piece

of suspended sail-cloth, and pass out into the night. They take the lantern along with them, again leaving the grotto in darkness.

The girls grope their way till they touch each other. Then, closing in an agonised embrace, they sink together upon the floor of the cavern!

## THE VANITIES OF NATIONS.

THERE is a bit of humorous description in Macaulay's *History* which reads almost like a page of Bunyan. In his picture of the Congress held at Ryswick in 1697 are to be found plenipotentiaries talking every language in Europe—members of the allied powers quarrelling among themselves for precedence, and fighting for the title of Excellency—preliminary consultations without end as to the number of horses and carriages, pages and lackeys, to which each member was entitled, and as to the right of serving-men to wear swords or to carry canes—the chiefs of either side principally engaged in watching each other's legs, so as to guard against a premature move of their own, as being inconsistent with their dignity. These and kindred vanities may have suggested the collecting together of the particulars relating to ceremonials, titles, forms, decorations, and the polite attentions of nation to nation, which Mr Frederic Marshall presents to us in his hand-book to the vanities of nations.\* The book is very entertaining, and in teaching might well be served up as a relish to the dry facts of history.

Although the origin of court etiquette is traceable to Philip the Good, Duke of Burgundy, it was in Spain that its fantastic growth was most luxuriant. A story is told of the wife of Charles II., who, catching her foot in the stirrup, as she fell off her horse, remained in a helpless condition in the presence of forty-three attendants. Motionless stood the attendants, and helpless hung the royal lady, because the equerry was out of the way whose duty it was to unhook the queen's ankle on such occasions. A passer-by who ventured to release Her Majesty was rewarded with gold for his services, but condemned to exile for his indiscretion. In France, the king could not visit a sick person in bed unless a second bed was prepared for His Majesty to occupy during the visit, since no subject could have been suffered to lie down while his sovereign was in a less easy position. In this way Louis XIII. visited Richelieu, and le Grand Monarque consoled with Marshal Villars after a wound received at Malplaquet. At Versailles, when Marie Leczinska was fretting because cards were interdicted on the occasion of court mourning, she was relieved by a courtier's assurance, that 'the game of piquet was deep mourning.'

In England at the present day, we have a Heralds' College to settle who shall walk first in a procession; an important point, considering that there are ninety ranks of men classed in order of precedence from the sovereign to a burgess. Pope Julius II. drew up a list of precedence among European sovereigns, twenty-six in number, of

\* *International Vanities*. By Frederic Marshall. W. Blackwood and Sons, Edinburgh and London.

whose titles it is noteworthy that four only exist in their old form—the Emperor of Germany, and the kings of England, Spain, and Portugal. It is easy to understand that ceremonial would hold especial tyranny in the strict circle of diplomacy. In 1661, the Spanish envoy, attacking the French ambassador in the streets of London, hamstringed his horses and killed his men, merely in order to get to court before his rival. In certain cases, every detail of diplomatic form was regulated by the strictest equality. Thus, we have seen the French and Imperialist envoys balancing step at the door of the Ryswick council-chamber; and when Mazarin and Don Luis de Haro met to settle the marriage of Louis XIV. with Maria Theresa, the two ministers stepped side by side into a room hung in corresponding halves with their respective colours, and sat down at the same instant on undistinguishable chairs. The First Napoleon was foolishly tenacious of precedence, and one year seized every copy of the *Almanach de Gotha*, because, in accordance with its custom of alphabetical arrangement, the list of reigning Houses therein published was headed Anhalt Duchies, and not Napoleon. Among other curiosities of court etiquette, it will not be commonly known, that an ambassador still has the privilege, though never used, of putting on his hat in the presence of the sovereign when he reads his reception speech. Maritime ceremonial was far more important than other forms, as being at one time the measure of maritime supremacy, and based on the theory that salutes should render the saluter temporarily powerless. In the time of James I., England insisted upon the disappearance of the flags and sails of all other ships as a salute to her own; and it was not until the end of last century that the resistance and disputes caused by such an overbearing requisition were finally settled, through the agreement of France and Russia to dispense with maritime salutes in any form. At this day, they are pure acts of courtesy between ships of war.

Coming to the subject of the form and wording of diplomatic documents, we learn that though the authorities could divide talk into six uses—court, diplomatic, church, judicial, school, and vulgar—yet that accident or fashion was the only guide in the choice of language for international communications, and that there never has been any generally admitted diplomatic tongue. Some of the most famous European treaties were in Latin, while French has been used in treaties drawn between two Teutonic governments. Nearly every nation now uses its own language for its despatches, and the curious words of a forgotten date, such as bulls, briefs, firmans, concordats, and a legion of such. Bull was the name of the ball-shaped leaden seal annexed to letters from the pope or the emperor, bearing on one side the image of St Peter and St Paul, and on the other the name of the reigning pope. The writing is in Gothic letters, inscribed on the rough side of the parchment. Bulls of grace are fastened with silk cords, bulls of justice with hempen strings. Briefs are less important; they are written in modern characters on the smooth side of the parchment, and sealed with the pope's own signet-ring. A concordat is a treaty with the Holy See on religious questions only. The private letters of the pope in his own handwriting are called *motus*

*proprii*, and are always headed by his own name in Latin. No mourning is ever worn by European courts for a deceased pontiff, because, according to the Roman theory, the pope does not die. We learn here, incidentally, that sixteen reigning sovereigns have abdicated during the last three hundred years, from Charles V. to Amadeus, and that 'letters of abolition, remission, or legitimization' are sealed with green wax, because that colour expresses youth, honour, beauty, and liberty. With so many diplomatic forms at hand, it is strange that there is no model for a declaration of war, though there are nineteen kinds of war which may be declared. There are wars of independence, insurrection, revolution, conquest, or intervention; they may be offensive, defensive, auxiliary, public, private, mixed, legal, illegal, religious, political, national, civil, and lastly—whatever the epithets may mean—perfect and imperfect. The practice of commencing treaties with mention of the Holy Trinity has been for a long time disused; and it is mentioned as quite exceptional that the Paris treaty of 1856 begins with the words, '*Au nom de Dieu tout Puissant*.' The signatures are in alphabetical order; but formerly, as may be believed, there was a great fight for places of honour, and various devices were adopted for the satisfaction of all parties, as at the signature of the Quadruple Alliance in 1718, when each power signed first the copy which it was to keep. At Aix-la-Chapelle, in 1748, the contracting parties each signed one copy for each of the others. By another system, each power was named first and signed first alternately. Treaties, like wars, have been divided and subdivided into numerous classes. It will be sufficient here to say that the five admitted species are, principal, lesser principal, accessory, additional, and subsidiary.

Our next vanity is that which is set in great dignity, and proceedeth from the titles of rulers. After Emperor and King ranks Grand-duke, which, originally a Russian designation bestowed by Ius V. on Cosmo de' Medici, survives only in Germany as a reigning title. The name of Elector, which for centuries was a great power in Central Europe, after gradual decay, was finally lost at Sadowa in the suppression of Hesse-Cassel by Prussia. Other titles are Czar, Margrave, Palatine, Landgrave (also blotted out in 1866 in the person of the ruler of Hesse-Homburg), Doge, Protector (borrowed by Napoleon from Cromwell on forming the Confederation of the Rhine), Stadtholder, Hospodar, Sultan, Calif (originally confined to the successors of Mohammed), Shah, Sheik, and Khedive. Emir is appropriated by the descendants of the Prophet, who are very plentiful in all classes of Turkish and Arabian society, especially among the beggars, and whose privilege and pride it is to wear green turbans. The sovereign's titles of possession were often derived from fictitious rights over places and countries with which he had no possible concern. Thus, the king of Sardinia was king of Cyprus, Sicily, and Jerusalem; the king of Naples also laid claim to Jerusalem; and our own monarchs were styled kings of France until the end of last century. Only fifty years ago the king of Portugal was officially styled 'Seigneur of Guinea, and of the navigation and commerce of Ethiopia, Arabia, Persia, and the Indies.' As it was usual to inscribe all titles of possession, real or feigned, in treaties and official documents, when

the names of two kings were found in the same parchment as ruling over the same territory, to avoid any disagreeable result, it was usual to insert a clause, called a *non-præjudicando*, stipulating that whatever titles were claimed nobody else admitted them, and that they were simply left in as ornament. Of religious titles, Holiness has belonged to the pope exclusively only since the fourteenth century, bishops and kings having used it previously. The designations bestowed on sovereigns by the Holy See are lost, save in England and Austria. The ruler of France once was Very Christian; to Portugal belonged the title of Very Faithful; to Hungary, that of Apostolic Majesty; the king of Poland was Orthodox; and our Henry VIII., it need scarcely be said, was the first Defender of the Faith. The title of Majesty was once religious only, and was adopted by the emperors, who had been previously Serenity and Grace. It was introduced by Henry VIII. into England, whose sovereign to that time had been known as His Highness and His Grace; but it was not until the year 1741 that the emperors would grant any other title than Serenity to the kings of the earth. Highness, when worn out by bishops and kings, was relegated to princes, who furnished it anew with the prefixes of Royal, Imperial, or Serene, or turned it into a curious shape, as did a certain Duke of Holstein, who became *Celsitudo Regia*, a name, as our author observes, more suited to a plant than a prince. Passing over *Monsieur*, *Excellency*, and *Eminence*, just noting that each son of the German Emperor was called 'Most Noble Purple-born'—a title derived from the purple chamber at Constantinople, in which it was necessary that the children of the Eastern emperors should first see the light—we close the curious scroll of titles with the mightiest of all, *Ten-o*, or *Heaven-Highest*, which the sovereigns of Japan have borne without a break for nearly two thousand five hundred years, the *Tycoon*, be it observed, being only a *Viceroy*, and *Mikado* a descriptive appellation exactly equivalent to *Sublime Porte*—a term which has a noteworthy explanation. A certain calif placed a fragment of the famous black stone of Mecca into the gate of his palace at Bagdad, which gate or port becoming an object of veneration, gave its name to the palace, and then to the government. So, too, the governments of Great Britain, France, and Spain have been known as the Courts of St James's, of the Tuileries, and of the Escorial.

If it be true, as Pope sang, that

A saint in crape is twice a saint in lawn,

we may rightly think that a decorated hero is doubly heroic. At all events, there is no doubt that the honour conferred by the right of tying a bit of ribbon in one's button-hole, of adorning the breast with silver and iron, or of placing a few capital letters after one's surname, carries a certain power socially and morally. The origin of all such decorations is traced by Mr Marshall to the rise of the monastic orders, for the history of which we must refer our readers to the book before us. Of the four knighthoods of Palestine—the Hospitallers of St John, who sprang from Italian merchants; the Templars, originally French; the Fraternity of St Lazarus; and the Teutonic Order, whose symbols were the well-known crosses, white, red, green, and black—but one now even

flickers, the Hospitallers. Of the eight first-class orders of the present day, our Garter and the Swedish Seraphim are the oldest; next comes the *Annunciada* of Savoy, dating from 1362; the *Golden Fleece* follows, now the joint property of Spain and Austria; then the *Elephant* of Denmark, instituted to commemorate the slaughter of an elephant by a Danish Crusader with his unaided sword. St Andrew of Russia, the *Black Eagle* of Prussia, and St Stephen of Austria, are all modern. The second category of orders includes the *Danebrog* of Denmark, the *White Eagle* of Prussia, and the *Bath of England*; together with the purely military decorations of St George of Russia, the *Iron Cross* of Germany, and our *Victoria Cross*. In the third class are found one hundred and thirty orders, divided among forty-three countries. Of these, Bavaria is credited with thirteen, while France has but one, the *Cross of the Legion of Honour*, which is in the hands of more than fifty thousand Frenchmen, and of about four thousand strangers.

In the category of Emblems our author places flags, shields of arms, badges, mottoes, crowns, national airs, and such vainglorious devices. The adoption of a public sign by states—as the owl of Athens and winged horse of Corinth—was common enough in very remote times; but though, of old, images were carried into battle, and banners were known to the Romans, the use of flags is not very old, having been introduced into Western Europe by Clovis. Wild animals for some time were a favourite design, which after Dagobert's eagle gave way to flowers, figures, crosses, flames, and saints. The oriflamme of Charlemagne was a blue banner with six red roses, probably so called from its flame-shaped ends. Its successor, the oriflamme of St-Denis, was of red silk, and though used as the official standard of France down to Agincourt, seems to have been rather a devotional than a political banner. The golden *fleurs-de-lys*, which studded the first royal standard of France, have been variously interpreted. They have been called lance-heads by some, bees by others; with others, *lys* is only a corruption of *Löys*—the signature of the first twelve Louis. By the addition of a white cross, the blue flag in process of years became white; but not until the reign of Henry IV. did the white flag definitely become royal. Two hundred years afterwards—in 1789—the union of the royal white with the rebellious red and blue—the colours of the city of Paris—formed the tricolour cockade; the first tricolour flag of red, white, and blue being unfurled a year later, and finally altered to its present combination of blue, white, and red. Our own Union-jack, with the crosses of St Andrew and St George, was constituted by a proclamation of James I., and received subsequently St Patrick's Cross for Ireland. The stripes of the American standard represented in 1777 the thirteen United States, the stars symbolising the Union. The Dutch flag, orange, white, and blue, was the earliest of the tricolours; the idea of which has been imitated not only by France, but by Belgium, Italy, and some minor states. Of devices borne on shields of arms, the double-headed eagle became the distinctive sign of the German Empire in Sigismund's time; it is now also Russian, differing in shape and colour from the older symbol. Prussia got her eagle from the Teutonic Order of Knights, when

Albert of Brandenburg, the last Grand Master, acquired the duchy of Prussia. The English shield originally bore only one lion: the three which it afterwards displayed for a time became leopards, but resumed their old form in the fifteenth century. With reference to the shapes of armorial shields, the only point we need note here is that the lozenge is assigned by all nations to women as representing a distaff.

Cockades, mottoes, war-cries, and national airs have a certain literature of their own. The tuft of grass worn by Marlborough's soldiers was the first military cockade employed on a large scale, and having blossomed into a knot of ribbons, or sometimes merely a bunch of papers, the cockade became general in European armies towards the middle of the eighteenth century. Our black cockade, which is Hanoverian, has been appropriated in France by nearly every one who keeps a carriage, the cockade of national colours being reserved for the servants of soldiers and dignitaries. Of crowns, those 'polished perturbations' of kings, we may note that the four fleurs-de-lys on the crown of England represent our old claims on France, and the four Maltese crosses symbolise our sovereign's title of Defender of the Faith. The iron crown of Lombardy, now preserved at Vienna, was so called from an iron ring made out of a nail of the true cross, which was placed inside the crown as a support. The pope's triple crown, the meaning of which has been variously explained, represents the material power of the pontiff, as the mitre is the emblem of his spiritual sovereignty. The Vatican treasury boasts of seven or eight of these tiaras, one of which, given by the queen of Spain in 1855, weighs only three pounds, and cost twelve thousand pounds sterling.

Savoy has a motto consisting of the letters F.E.R.T., which nobody can interpret; Austria's motto is A.E.I.O.U., signifying, in Latin, that she rules over the universe; 'Mit Gott für König und Vaterland' is Prussian. Neither France nor England has a national motto, our own 'Dieu et mon Droit' belonging merely to the royal arms. On the other hand, our war-cry of St George for England, and the Spanish Santiago, are purely national, while most of the other cries reputed national were peculiar to a chieftain or a party. National airs properly so called seem to be scant in number, and very modern; our own hymn, composed by Dr Carey, and first sung in 1740, being the oldest. Russia has a national hymn, but not France, such airs as the *Marseillaise* and *Partant pour la Syrie* being republican and warlike, but not national. Nor can any of the patriotic chants of Germany claim to be national in the sense of being officially recognised.

For some interesting gossip about ambassadors and aliens, we must refer the reader to Mr Marshall's book. In his last chapter, on Glory—the vanity of vanities—we are rightly reminded that more than half of the accepted glories of the world have sprung from civil sources; that the progress of sciences, and arts, and letters, has raised up a larger mass of spotless fame than all which the world has known from the power of the sword; and that, dazzled by the splendour of its array, we scarcely realise the moral blank which the curse of war creates, the suppression of all right and conscience which accompanies it. This is the glory which, like the circle in the water, by broad spreading

disperses to nought, in quest of which man plays such fantastic tricks, as 'make the angels weep.' If glory attained by the exercise of virtue be a vanity, surely the glory of war is 'the wickedness of folly, even of foolishness and madness.'

## THE MONTH:

### SCIENCE AND ARTS.

*THE Autobiography of Sir John Rennie*, just published, is a book well worth reading. It records the labours, opinions, and observations of one who, as civil engineer, stood in the first rank of his profession; in whom were combined with an ardent temperament, power of endurance, fertility of resource, and keen insight into men and things. He never lost hope even under the most adverse circumstances, and had a capacity for work which seems incredible. In some respects the book may be regarded as a history of civil engineering from the commencement of the present century, for failures are noted as well as successes; its descriptions of engineering works contain particulars and suggestions which may be read with profit; young men entering the profession may study with advantage the scheme of education which Sir John has drawn up in their behalf. Many of the descriptions are such as would interest an unprofessional reader, especially as they are relieved by interesting passages of travel and adventure.

Within the past few years we have known, here in the British Islands, what is meant by drought; and warnings against waste of water have been published. On this point Sir John Rennie remarks: 'We shall continue to suffer from these droughts until men come to understand that only a certain and known quantity of water falls upon the earth, and that at certain periods; and that it is necessary to store the surplus waters to supply the deficiency of the dry season.' The present has been a wet year: let us hope that the abundant rainfall has not been allowed to run away to waste.

Birmingham is about to realise in part the *city of health*, of which a rather fascinating sketch was given by Dr Richardson at the meeting of the Social Science Congress. In that busy town there are foul and squalid quarters, as in other of our large towns, and these are to be destroyed, to make room for new and broad streets, with dwelling-houses and other buildings in which the working population will have opportunity to live with comfort and decency, hitherto unattainable. The clearance will extend over forty-three acres, and by means of good streets the rebuilt district will be brought into easy communication with the best parts of the town. All the new buildings are to be so placed as to command light and air on at least two sides; and each house will have a water-supply and a separate retreat. Should this experiment succeed, and it can hardly fail, Birmingham intends to purify all its foul districts in a similar way. Meanwhile, the Town Council have bought the waterworks; the inhabitants will thus be independent of a

company, and will have the control of the water supply. The example, which, by the by, was previously shewn by the city of Edinburgh, is a good one for other towns to follow.

In the discussion on Fermentation which took place last year in Paris, Mons. Dumas, Secretary of the Académie des Sciences, pointed out the remarkable effect of borax on fermentation, and suggested that a study of the phenomenon would lead to highly important consequences. Professor Schnetzler has taken up the subject, and in the *Bulletin of the Vandoise Society of Natural History* at Lausanne, has published a few results which are well worthy of attention. Spores and vegetable cells plunged into a solution of borax, go through certain strange movements, and are then killed. Cells in movement in a living plant are at once arrested in their action. The *Oidium Tuckeri*—the fungus from which vines have so greatly suffered—dies in a solution of borax. Perhaps a concentrated solution would be useful in extirpating poisonous fungi from places where they grow. Rotifera and other small creatures, and the spawn of frogs, are speedily killed by introducing a small quantity of borax into the water in which they had been living.

These observations, says Professor Schnetzler, 'demonstrate that borax puts an end to the properties by which the life of vegetable and animal protoplasm is manifested. If fermentation is a chemical phenomenon brought about by the life of the leaven, then borax would necessarily set against fermentation.'

A further series of experiments followed. Grapes in a solution of borax were put into a bottle, and closely corked. There was no sign of fermentation after long keeping; but the grapes, though well preserved, were not eatable. Thirty centimetres of milk, with one gramme of borax, were bottled for some months, and did not turn sour; retained, in fact, the scent of new milk. One pound of beef was shut up (not hermetically) in a tin box in concentrated solution of borax. The liquid became red, then brown, and gave out a disagreeable scent, but the meat did not putrefy. The meat was taken out, and washed. It had a peculiar odour, but not that of putrefaction. It was kept more than a year, and through the heat of two summers (the liquid having been renewed three times), and turned yellowish in colour; but still no putrefaction appeared. The meat, we are told, was as soft and tender as fresh meat, and kept well when out of the liquid.

The experiments were carried on in different ways, with a view to bring out all the phenomena, and arrive at trustworthy results. Professor Schnetzler thinks that the peculiar odour of meat which has been kept some time in a solution of borax proceeds from the decomposition of matters produced by metamorphosis of the substances which compose the muscular fibre. And without seeking to attach too much importance to the experiments, he considers that they indicate a way for the preservation of meat, of fruits, of anatomical preparations, whether animal or vegetable. Hitherto, alcohol has been made use of for that purpose, but henceforth a solution of borax may take its place. And, further, it would be interesting if, in some hospital, the effect of the solution on certain wounds were made a subject of experiment.

The natural gas which, in certain parts of Pennsylvania, rises from the earth in prodigious quantities, has been used as fuel in the heating of furnaces and puddling of iron, with very satisfactory results. An attempt is now to be made to render it available at a long distance; and the proprietors of ironworks in Pittsburgh have planned to lay down a six-inch iron pipe, seventeen miles long, from the source of the gas in Butler County to their works in the city. Thus the fuel will of itself flow to the fire.

Mr Tichborne, F.C.S., has thought it worth while to examine the printing-inks of the sixteenth and seventeenth centuries, with a view to discover the kind best suited for printing books or works of art which are to be long preserved. The ink at present in use, he says, consists of carbon in a fine state of division, ground up with a mixture of oils, soaps, and a substance called printer's varnish, which in all good printing-ink is linseed-oil specially prepared. It is by means of this oil, when properly prepared, that the ink or pigment adheres firmly to the paper. Mr Tichborne has examined specimens printed in different parts of Europe, and finds 'that the older printing-inks are more easily saponified and washed off by alkalies, than those of the last century. In their general character,' he remarks, 'they agree; as carbon seems to have been the basis of printing-ink from the time of Johann Faust, and for this reason printed matter will bear the action of acid oxidisers, or bleachers, with impunity; but many, if not all the printing-inks of the fifteenth and sixteenth centuries are more or less sensitive to the action of alkalies. Some are so extremely sensitive, that on introducing them to a weak solution of ammonia, the characters instantly float off the surface of the paper, although they may have previously withstood the action of a powerful acid bleaching bath. The only explanation I can offer is, that the oils used as vehicles were not formerly submitted to the boiling process which, in the modern inks, has thoroughly resinified them.'

In the *New York Medical Journal* for October last, an interesting account is given of successful removal of a tumour by means of 'galvano-puncture.' A glandular swelling of the size of a hen's egg, and a cystic tumour of smaller size, had formed just below the jaw of a young man. The practitioner 'considered the case an excellent one for electrolysis,' but first tried the direct galvanic current, which, after a number of applications, softened the glandular tumour. Galvano-puncture was then adopted: two fine sewing-needles were passed into each tumour, and were connected with the positive and negative electrodes of a thirty-two cell battery. As soon as the connection was complete, 'hydrogen gas rushed in a torrent of foam from the negative needles, the cystic tumour vanished instantaneously, and the other grew rapidly less; in two minutes it commenced to blacken, and the needles were removed.' After some further treatment, the whole mass came away, and left a large clean wound, which healed up without contraction or puckering, and without pain or inconvenience to the patient.

Remarking on this case, Dr Cohen, the practitioner above referred to, remarks: 'The operation was begun and finished in two minutes and a quarter, without the loss of one drop of blood (the puncturing of the skin excepted), and the action of

the current being, to all intents and purposes, a subcutaneous dissection. The advantages gained are, therefore, rapidity, safety, entire freedom from hemorrhage, protection from the air; while the immediate effect of the operation is to convert the tumour into a slough, which, with the assistance of a poultice, is thrown off in a few hours or days. To these we may add another advantage, namely, the avoidance of ugly scars. It is thought by competent surgeons that this same remedy may be applicable for the cure or mitigation of cancer.

There are few persons who do not know what is meant by noises in the ears; sometimes they are twittering noises, sometimes chirping, sometimes ringing, sometimes rumbling. The cause or occasion of these noises has been, during hundreds of years, a question which has never yet been answered, except in the suggestion that it originates in some form of disease. Such being the case, Dr Theobald, of the Baltimore Eye and Ear Dispensary, comes forward with his explanation of the cause of *tinnitus aurium*, which is the medical term for noise in the ears. He does not consider, as some do, that the noise originates in the brain, but rather in the external ear. 'I think,' he says, 'we may safely conclude that *tinnitus* is invariably the expression of an excitation of the terminal or percipient elements of the auditory nerve.' The doctor then proceeds to shew that the excitation in almost all cases, 'whether associated with aural affections, cerebral diseases, or constitutional disorders, is to be attributed to the existence of vibrations excited in the walls of the blood-vessels of the labyrinth by the friction attending the circulation of the blood.' Examples are given in support of this opinion. Small things produce great effects within the passage of the ear: the quick moving wings of a tiny insect there make a noise that sounds like thunder. So the friction of the blood in the small vessels produces the disturbance known as noises in the ears. Readers who desire to see the whole of the doctor's argument will find it in a pamphlet reprinted from the *Transactions* of the Medical and Chirurgical Faculty of Maryland, U. S.

A recent number of the *Journal* of the United Service Institution contains instructive papers, with maps, of the military geography and highways of Central Asia, which may be read with advantage by any one interested in the subject. There is also a paper on the Scientific Study of Naval History, by Mr Laughton of the Royal Naval College, Greenwich, full of matter for serious consideration. It is there shewn how it was that we won the so-called 'sovereignty of the sea' in days when the whole shipping of the country was the British navy. Then arose the necessity for strategical and tactical skill; and the nations who had not advanced therein became demoralised. But as Mr Laughton remarks, this is changed. 'In a new war we shall have to contend against ships well built, men carefully organised and trained, officers educated to the utmost extent of modern science, practical as well as theoretical; and to meet these altered circumstances, we must have 'not the mere rehearsal of gallant deeds and hair-breadth escapes, but the close, exact, and scientific study of the history of organisation and discipline, of defeats as well as of victories, of failures as well as of successes.' If the Royal Naval College trains its students in the way here indicated, the officer of

the future will not be insufficiently educated, and our ironclads will not be allowed to sink to the bottom by accident.

A communication made by Mr E. Cortambert to the Société de Géographie at Paris, takes up a branch of Mr Francis Galton's comprehensive subject—Heredity, for it treats of the *Densité des Forces Intellectuelles des Diverses Parties de la France*—or Geographical Distribution of celebrated persons. Mr Cortambert published a few results of his inquiry twenty years ago; he has now more facts to help him in his research of the 'mysterious link which exists between the intellectual faculties of man and the soil, temperature, and all other physical and ethnographical influences.' An illustrative map, properly coloured to shew the facts, was exhibited at the meeting of the Geographical Congress in Paris last summer.

In this map the North, and particularly the valley of the Seine, shews the greatest wealth of intellect, which may be accounted for by the convergence of the population towards Paris. Normandy shews well, and contrasts remarkably with its neighbour Eure, as also with the Pas de Calais, which appear to be deficient in brain. The provinces of Champagne and Burgundy have been fruitful of great men, particularly the Cote d'Or district; and in the same category may be placed the South properly so called.

The departments of the second rank are Vaucluse, du Var, du Gard, Basses Pyrénées, and Lot-et-Garonne; and those which shew palest on the map are, the Lozère, Pyrénées Orientales, Hautes Pyrénées, and Tarn-et-Garonne. The western part of France is also generally pale, with here and there a noteworthy exception, as at St Malo—and Brittany, so celebrated and self-asserting, is not equal in intellect to regions of the same extent in the North, South, or East. 'It seems,' says Mr Cortambert, 'that the Celtic blood, which, in those western extremities of the country has been preserved more intact than elsewhere, is less favourable to intellectual fecundity than the mixture of races found in the valleys of the Seine, the Scheldt, the Meuse, the Rhine, the Saone, the Rhone, and the Garonne.'

Going into particulars, Mr Cortambert shews that the North is not only most fruitful in savants—men of science, painters, warriors, chroniclers (of whom we have a type in Froissart), but also of poets. 'Yes!' he says, 'the langue d'oïl, the country of the Trouvères, has by far surpassed its rival the country of the Troubadours.' In Burgundy, Franche Comté, and the Lyonnais, he finds a genius for natural and medical sciences. In the East, eloquence prevails, but still more in the South; and the South by its ardour dominates at times the more powerful North. The West produces brave seamen and renowned travellers.

With a view to personify the several regions, Mr Cortambert assigns Voltaire to the North, Buffon to the East, Guizot to the South, Châteaubriand to the West, and Descartes to the Centre. He confines his illustrations to individuals no longer living; but he intends to continue his investigation, and to extend it to other countries of Europe. The result cannot fail to be interesting.

## AMERICAN TROUBLES.

TWENTY-TWO years ago, when in Richmond, Virginia, we sauntered up a cross street to see the auctions of negro slaves, men, women, and children, that had been advertised the previous day. The spectacle, as described in these pages at the time, was startling and painful. On turning away from the scene, we felt that the terrible blunder of rearing the negro races for sale, as farmers breed cattle and sheep, would some day bring its own punishment. Vengeance has fallen on the wrong-doers, and acutely. The introduction of negro slaves into the American colonies previous to the Declaration of Independence was bad enough, and let the blame of that be borne by England; but bad as it was, the crime or error—call it what we will—was nothing in comparison to the persistent effort of the States in augmenting the numbers of African slaves in the first place by importation, and subsequently by a legally recognised process of slave-breeding for the public market. It was a market of that kind we saw in 1853. The fact is undeniable, for in evidence we have the memorandum obligingly furnished and signed by a firm of slave-merchants, specifying the prices at which they could supply men, women, and boys according to age and capacity. Historically, a curious and valuable document that!

Though shocked at seeing these unfortunate objects of sale hauled about and handled like cattle, and detesting the whole system of traffic, we never fell in with the notion that mentally there was no difference between the black and white races. On this point, as we think, there has been a considerable confusion of ideas. Sentiment obscured the actual facts of the case. Not till after the war in which the whole of the slaves throughout the States were abruptly emancipated, and put on a political level with whites, did the subject receive proper consideration. North and South are now taking a more dispassionate view of the negro character. There is a growing feeling that both sides were in error, and out of that tardy conviction good may come.

We remember being told by a gentleman who had long had opportunities of coming to a correct judgment, that do as you will, educate as you will, the intellectual capacity of the negro, as more expressly viewed in relation to calculation and foresight, does not generally get much beyond that of an English boy fourteen years of age. There, he said, the negro brain is arrested. In other words, grown negroes are mentally so many boys—lively, impetuous, fond of frivolity and finery, with little care about the future, and satisfied on being allowed to gravitate into the position of cooks, or what will yield a sufficient degree of animal comfort. The view thus taken was, perhaps, too decisive; but to a certain extent it has been justified by experience. The negroes of Hayti have been their own masters for more than eighty years, and we all know what a poor figure they have cut in the nationalities of the world. Sentiment and scientific truth might come to a common understanding on the subject. The negro races have their niche in creation, and all we have to do is to find it out—not thrust them into niches for which they are visibly unfitted. The radical error was that of ever bringing them away from their own country, which was clearly their proper sphere.

These remarks occur to us from the perusal of a work called the *White Conquest*, by W. Hepworth Dixon, just issued from the press. A few years ago, Mr Dixon wrote a book on America, of which this is a kind of sequel. The style of the new production is too dramatic and oracular for our taste, but we leave that to the critics. There is material for thought, and that is the main consideration. From investigations on the spot, the object of the writer is apparently to shew that the people of the United States have got themselves into a somewhat awkward condition, first by their constitutional principle, that all men are equal and eligible for office; and second, by the vast numbers not only of negroes but of Chinese who are in the course of being incorporated in the body politic. Here, we should say, is a nut to crack. A negro born in the States, and consequently a natural

citizen, is politically eligible as a Senator or President, and at all events he is potential as a voter. So is the son of any of the Chinese, who are now crowding into California and adjoining parts on the Pacific slope. Heathens with an artistic aptitude rivalling that of Europe, who can live munificently on twopence a day, and whose religion consists in burning bits of perfumed paper before an idol in a joss-house, are pushing from their stools the descendants of Anglo-Saxons. That, according to our author, is what things are coming to. Rather hard, this, on our American friends!

The pinch, as we see, is colour. Across the Atlantic from the coast of Africa have been idiotically imported blacks, now numbered by millions. Across the Pacific from Canton and Hong-kong are pouring yellow Chinese in thousands, tens of thousands. No one can tell when or how this yellow deluge is to be stopped. In one sense, 'White Conquest' is a misnomer. Colour Conquest would seem to present a more correct aspect of affairs. We are not without a hope that the whites will get out of the scrape somehow. Yet, undeniably, Mr Dixon's book offers matter for very grave consideration.

It may not be generally known that certain native Indian tribes who had made some advance towards settled habits, Creeks, Choctaws, Seminoles, Chickasaws, and Cherokees, possessed negro slaves like their white neighbours. The condition of these poor blacks, held in bondage by almost unmitigated barbarians, is described as having been frightful. 'To be a white man's thrall was bad enough; but on the worst plantation in Georgia and Alabama there were elements of tenderness and justice never to be found in the best of Cherokee camps. . . . In every Indian camp the squaws behaved in a harsher manner towards the negro than their brutal spouses; and instead of an Indian child acting as a check on cruelty, his presence often led to the slave being pinched and kicked, so that the young brave might learn to gloat over the sight of men in pain.' Emancipation put an end to these atrocities. The negroes held in bondage by the Indians were freed, but where to go or how to support themselves formed a difficult problem. Turned out of the Indian camps, ten thousand human beings were houseless and friendless. 'Where could they find shelter from the snow and rain? Without guns and ponies, how were they to follow deer and elk? They had no nets for taking fish, no snares for catching birds. . . . Brought up with squaws, they had the ways of squaws.' Some made their way to the white settlements. Others squatted at Caddo, an abandoned piece of ground, and there they formed a rude kind of community. They were not all black. The younger members of the community were a mixed breed, known as Zambos, descended from a negro father and an Indian mother. Living here in a miserable way on sufferance, they may be turned adrift at a day's notice, and they certainly merit compassion.

From an account of these poor people, Mr Dixon diverges into the theory of colour. 'While sauntering in and out, among the stores and yards at Caddo, we chance to kick an ant-hill, and disturb the small red warriors in their nest. Like all the South and West, this dry and sunny spot is rich in ants—red, black, and yellow ants—among them the variety known as Amazon ants. All ants appear to live in tribes and nations, under rules which never change. Like Indians they have their ranks and orders—patriarchal, military, servile; and, like Indians, they hold their property in a common lot. The patriarchs, set apart as fathers and mothers, live an easy life, and pass away when they have done their part. These chiefs among the ants are winged. They soar and pair, eat up the choicest food, and die with mandibles unstained by vulgar toil. Next in rank come the soldiers; ants with strong mandibles, but no wings. Lowest in order stand the serfs or bondmen. Food must be sought, and chambers bored; wherefore a majority of ants are serfs, and all these servile ants are squaws. No male ant ever earns his bread. Scorning to delve and spin, he asks his female architects to build his cell, and sends his female foragers to seek his food. These servile squaws, arrested in their growth, and having neither wings nor ovaries, are content to drudge and slave. But Amazon ants have souls above these ordinary squaws. The Amazons would rather fight than drudge, and, like all fighting creatures, they become the owners of such poor species as would rather drudge than die. A colony of black ants usually settles near a colony of red. Does Nature mean her duskier children to be seized and made to labour for the fairer kinds? The red ants hunt them down. A red ant is no bigger in body, no stronger in mandible, than a black ant; yet the Amazons always beat their duskier sisters and enslave their brood. Is this result a consequence of their coats being red? Who knows the mystery of colour?'

The inference to be drawn from these remarks cannot bear any weight in a question which is purely of practical concern. How are the hordes of blacks to be got rid of? That is the point at issue. According to most authorities, perfect liberty is said to be not only unfavourable to their increase, but a cause of diminishing numbers. Our author speaks of infanticide, but there are other vices incidental to negro freedom which have a tendency towards extinction of race. Want of energetic foresight would in itself put the blacks at a serious disadvantage. For these and other reasons, it does not seem that the whites should be apprehensive of being ultimately submerged by their negro fellow-citizens. There is more to fear from the recent and quietly conducted yellow invasion. China, with its teeming population of four hundred millions, and situated next door to the attractions of California, could with ease stock the American continent from side to side with inhabitants, and leave plenty over for Great Britain,

where ship-loads of them may by-and-by—as a beginning—be expected. The probable consequences, in 'the graver aspects of the case,' says Mr Dixon, 'though seen by men of science, have never yet been faced by politicians. A thinker here and there has asked himself—How this invasion of barbarians will affect the European races in America? But he has shrunk appalled from his own query as the Yellow Spectre rose before his mind.'

We have not space to follow the author of *White Conquest* into his numerous details regarding the deluge of yellow heathens now fairly set in. It is enough to say that, under the fostering care of Chinese associations, the process of immigration appears to be efficiently managed. Settling down, the yellow intruders make excellent cooks, and out-shine in the work of housemaids and laundresses. They are civil, do not drink, and are anxious to make themselves useful. By their saving habits and modest wants, they shew a degree of foresight far beyond that of Indian or negro races. We are told that John Chinaman 'will live and save where Pat must shrink and fall.' Those who came first 'were labourers, and their first rivals were navvies and hodmen. John drove these rivals off the field, doing more work at less cost, and pleasing his employers by his steady doings and silent ways. John builds the chapels, banks, hotels, and schools. No room is left for the unskilled Irish peasant, and the movement of Irish labourers towards this Slope has ceased.' The most surprising feature in the character of these Chinese is the quickness with which they pick up any trade. They have only to see a thing done to be able to do it. With this aptitude, and their willingness to work for wages greatly below what are demanded by white artificers, they have soon the field to themselves.

In illustration, Mr Dixon gives some amusing particulars concerning Yin Yung, a Chinaman, reckoned to be the best bootmaker in California. He came to the country wholly ignorant of the 'gentle craft,' but anxious to learn that or anything. One Aaron Isaacs, a Jew bootmaker, with no objections to cheap labour, gave him work, with directions what to do. Seeing how others worked, he soon was as clever at his trade as they were. Being able to instruct his countrymen, Yin Yung set up for himself, and now has a large business in the boot and shoe line. Of course, those whom he teaches swarm off to do the like, and so the trade is absorbed by Chinese. Isaacs, the original instructor, does not like to see this, but he cannot suppress a fair rivalry. The account given of a similar outcome in the watch-trade is quite as interesting. Paul Cornell, at the head of a watch-making company, engaged seventy hands from Chicago to help him in his business, money being advanced to pay the railway fares for themselves and their families. They were employed very much as a staff to instruct Chinese, but that they were not aware of. They remonstrated on seeing Chinese in the workrooms; they appealed to their trade-union. Cornell, sustained by Ralston, a banker, stood firm. A deputation waits on the great banker to try and move him. Ralston's reply was Napoleonic. He and other members of the company would hire Chinese or any other race of men if they saw it expedient. They would, if they liked, send for watchmakers from Switzer-

land. The company would not be dictated to. The Chicago artisans might leave if they felt inclined. The result of the interview was that the company employed the Chinese, into whose hands the watchmaking trade will finally drift. 'Here,' adds our author, 'as elsewhere in California, Oregon, and Nevada, the rice-eater is pushing the beef-eater to the wall.' And he will do the same thing in England, when he once gets a footing. There is no law to stop him. Trade guilds and unions can no more shut out Chinese workers than the husbandman on the prairies can avert the approach of destructive swarms of locusts which cover his lands six inches deep.

The worst thing about these yellow rice-eaters is that when left to themselves they are usually dirty in their habits, and live in dens little better than pigsties. In San Francisco, a wealthy Chinese, Lee Si Tut, has leased an old hotel with sixty rooms, and lets it out to eight hundred tenants. The rooms are divided by mats, and each division is fitted up with shelves, on which the inmates lie. Each man has his own shelf, but the landlord complains that his tenants cheat him by taking in lodgers, some of them subletting their shelves for ten or twelve hours. 'In some rooms, three sets of lodgers occupy the shelves each twenty-four hours—eight hours apiece.' So that in point of fact about fifteen hundred Chinese are accommodated in a single building. In England, we should know how to deal with this nuisance by a smart application of the Police and Public Health Acts.

In his very suggestive work, which it would be superfluous to recommend, Mr Dixon calls attention to one or two topics of quite as serious concern to Americans as the embarrassing number of negroes, and the ever-increasing hosts of yellow intruders. First, he notices the unhappily increasing disproportion of the sexes among the whites. In most parts of the country there is a comparative scarcity of women. According to the census of 1870, the excess of males over females in the United States and Territories was four hundred and sixty-nine thousand. The phenomenon is accounted for by the copious immigration of single men, or married men without their wives. The disproportion works mischievously. It is always a bad business when every man cannot be provided with a wife, and the right thing is to have a variety to choose from. Where there happens to be a scarcity of women, matters are not greatly mended when those who are so fortunate as to get wives find that they are not worth much. There is a prodigious deal done in the States to educate girls in the higher branches of knowledge—foreign languages, mathematics, and so on—what, however, signifies school learning for women, if they are physically incapable of fulfilling the proper destiny of their sex? We must quote the telling words of Mr Dixon: 'Catherine E. Beecher, an advocate for woman's freedom, has made inquiries into the physical health of American females, and the result is, that among her "immense circle of friends and acquaintance all over the Union, she is unable to recall so many as ten married ladies, in this century and country, who are perfectly sound, healthy, and vigorous." Passing beyond her own large circle, Catherine Beecher goes into twenty-six towns, and takes ten average cases in each town. Of two hundred and sixty ladies, only thirty-eight are found in a fair state of health.

Sixty other towns are tested, with a similar result. If these returns are good for anything (and they are quoted with approval by government officials), they prove that only one American woman in ten is physically fit for the sacred duties of wife and mother!

Pampering, a desiccating atmosphere, rooms overheated with stoves, and want of that healthy outdoor exercise in which English women rejoice irrespective of the weather, may partly account for this lamentable state of things. Anyway, there is something wrong, which school culture has not reached. 'Three years ago,' continues this observant writer, 'the Bureau of Education printed a paper on the *Vital Statistics of America*, which passed like an ice-bolt through the hearts of patriotic Americans. This paper showed that the birth-rate is declining in America from year to year; not in one State only, but in every State. The decline is constant and universal; the same in Arkansas and Alabama as in Massachusetts and Connecticut, in Michigan and Indiana as in Pennsylvania and New York. . . The birth-rate is admitted to be larger among the immigrants than among the natives; yet the average, thus increased by strangers, is lower than that of any country in Europe, not excepting the birth-rate of France in the worst days of Louis Napoleon.' What will be the end of this can easily be foreseen. If the States cease to be recruited by fresh European immigrants—and that seems likely—they must inevitably languish as a white community. 'Some of the ablest statisticians and physicians of Boston have come to the conclusion that the White race cannot live on the American soil.' Mr Dixon fixes on disproportion in the sexes for this result; but we venture to think that several other causes are equally, if not more concerned. There is an observable want of robustness in the physique in most of the native whites; and unfortunately, intellectual acuteness will not, in a national point of view, compensate for muscular deficiency. This fact has been well put by Captain Burton in his remarks on the degeneracy of certain races: 'The true tests of the physical prosperity of a race, and of its position in the world, are bodily strength, and the excess of births over deaths.' In these respects there would appear to be a shortcoming in the United States, but the subject is too delicate and difficult for our handling, and we resign it to physiological inquirers.

If it be really the case that the native white race is getting into a moribund condition, and that the blacks are also likely to perish, we can see no other probable consequence than that the yellow colour is destined to carry the day. May that day be long in coming. It would be worse for Europe, worse for everybody, if the whites in the United States, with their immense ingenuity and enterprise, sunk under a deluge of rice-eating Mongols.

Meanwhile, we prefer to take a cheerful view of the future. Things may not be so bad as they look. The world is, at anyrate, beneficently full of compensations. Our American friends no doubt derive some comfort from knowing that the plague of Mormonism seems likely to disappear. When Mr Dixon formerly visited the colony of Saints in Utah Valley, he found Polygamy in full swing. It is now, he tells us, getting out of repute, not from any absolute change of doctrine, but from an improved taste in female

attire. The railway is said to have done it all. So long as wives were content to be dressed in cheap calicos, like charwomen, their number in a household was financially a matter of indifference. The railway has revolutionised the female costume, by bringing ladies dressed in the height of fashion. Now, there is a furor of imitation, and husbands shrink from the expense of decorating several 'fine ladies.' A curious instance this of a moral reform being effected by an unwillingness to pay for millinery. Brigham Young with his large resources may bear the strain, but bills coming in of a thousand dollars apiece for lady after lady is what no ordinary Mormon can put up with. In short, Polygamy is discovered to be wrong, and such being a growing opinion at headquarters, we do not expect to hear much more of this American monstrosity. W. C.

## THE FLAG OF DISTRESS.

### CHAPTER XLV.—OCEANWARDS.

ANOTHER day dawns over the great South Sea. As the golden orb shews above the crest of the central American Cordillera, its beams scatter wide over the Pacific, as a lamp raised aloft, flashing its light afar. Many degrees of longitude receive instant illumination, at once turning night into day. An observer looking west over that vast watery expanse, would see on its shining surface objects that gladdened not the eyes of Balboa. In his day, only the rude Indian *balsa*, or frail *periagua*, afraid to venture out, stole timidly along the shore; but now huge ships, with broad white sails, and at rare intervals the long black hull of a steamer, thick smoke vomited forth from her funnel, may be descried in an offing that extends to the horizon itself. Not always can these be seen; for the commerce of the Pacific is slight compared with that of the Atlantic, and large ships passing along the coast of Veragua are few and far between.

On this morning, however, one is observed, and only one; she not sailing coastwise, but standing out towards mid-ocean, as though she had just left the land.

As the ascending sun dispels the night darkness around her, she can be descried as a white fleck on the blue water, her spread sails seeming no bigger than the wings of a sea-gull. Still, through a telescope—supposing it in the hands of a seaman—she may be told to be a craft with polacca masts; moreover, that the sails on her mizzen are not square-set, but fore-and-aft, proclaiming her a barque. For she is one; and could the observer through his glass make out the lettering upon her stern, he would there read the name, *El Condor*. Were he transported aboard of her, unaware of what has happened, it would surprise him to find her decks deserted, not even a man at the wheel, though she is sailing with full canvas spread, even to studding-sails—no living thing seen anywhere, save two monstrous creatures covered with rust-coloured hair—mocking counterfeits of humanity! Equally astonished would he

be at finding her fore-castle abandoned; sailors' chests with the lids thrown open, and togs lying loose around them. Nor would it lessen his astonishment to glance into her galley, and there behold a black man sitting upon its bench, who does not so much as rise to receive him. Nor yet, descending her cabin stair, to see a table profusely spread, at either end a guest, alike uncourteous in keeping their seats, on the faces of both an expression of agonised despair. And all this might be seen on board the Chilian vessel, on the morning after abandonment by her traitorous and piratical crew.

A fearful night has it been for the three unfortunate men left in her, more especially the two constrained to sit at her cabin-table. For both have other thoughts, more bitter than confinement; enough to fill the cup of their anguish to the very brim. They did not yield unresistingly. Even the gentle skipper struggled, stormed, and threatened, till overpowered by brute force, and firmly bound. In like manner had Don Gregorio behaved, till resistance was of no avail; then, making appeal to the humanity only of his assailants, to find this alike idle. A dread hour that for the ex-haciendado. Not because of his treasure, the bulk of his fortune, borne off before his eyes; but from the double shriek which, at the instant, reached him from the deck, announcing the seizure of that more dear. Carmen and Inez were evidently made captive; and, from their cries suddenly ceasing, he dreaded something worse. Had they been stifled by death? Being reminded of an event in Yerba Buena, as also the recognition of the ruffian who taunted him, but made it the more probable that death had been their fate. He almost wished it; he would rather that, than a doom too horrible to think of.

The first-mate? He must have been killed too; butchered while endeavouring to defend them? The unsuspecting captain could not think of his chief-officer having gone against him; and how could Don Gregorio believe the man so recommended, turning traitor? While they are thus charitably judging him, they receive a crushing response. Just then, to their astonishment, they hear his voice among the mutineers; not in exhortation or opposed, but as if taking part with them! One, Striker, is calling out his name, to which he answers; and, soon after, other speeches from his lips sound clear through the cabin windows, open on that mild moonlit night. Still listening, as they gaze in one another's face with mute, painful surprise, they hear a dull thud against the ship's side—the stroke of a boat-hook as the pinnace is shoved off—then a rattle, as the oars commence working in the tholes, succeeded by the splash of the oar-blades in the water. After that, the regular 'dip-dip,' at length dying away, as the boat recedes, leaving the abandoned vessel silent as a graveyard in the mid-hour of night.

Seated with face towards the cuddy windows, Don Gregorio can see through them, and as the barque's bow rises on the swell, depressing her aft, he commands a view of the sea far astern.

There, upon the surface, he makes out a dark object moving away. It is a boat filled with forms, the oar-blades rising and falling in measured stroke,

flashing the phosphorescence on both sides. No wonder at his earnest look as he bends his eyes on that boat—a gaze of concentrated anguish! It contains all that is dear to him—bearing that all away, he knows not whither, to a fate which chills his very blood to reflect upon. He can trace the outlines of land beyond, and can perceive that the boat is being rowed for it, the barque at the same time sailing seaward, each instant widening the distance between them. But for a long while he can distinguish the black speck with luminous jets on either side, as the oar-blades intermittently rise and fall in the clear moonlight, till at length entering within the shadow of the land—a line of high cliffs—he loses sight of it.

'Gone! all gone!' groans the bereaved father, his beard drooping down to his breast, his countenance shewing he has surrendered up his soul to a despair hopeless as helpless! So, too, Lantanas, who has ceased struggling and shouting. Both are now alike convinced of the idleness of such demonstrations. The chief-officer a mutineer, so must all the others; and all have forsaken the ship. No; not all! There is one remains true, who is still on her—the black cook. They hear his voice, though not with any hope. It comes from a distant part in shouts and cries betokening distress. They need look for no help from him. He is either disabled, or, like themselves, securely bound. Throughout the night they hear it; the intervals between becoming longer, the voice fainter, till he also, yielding to despair, is silent.

As the morning sun shines in through the stern windows, Don Gregorio can see they are out of sight of land. Only sea and sky are visible to him; but neither to Lantanas, whose face is the other way; so fastened he cannot even turn his head. The barque is scudding before a breeze, which bears her still further into the great South Sea, on whose broad bosom she might beat for weeks, months, ay, till her timbers rot, without sighting ship, or being herself desecrated by human eye. Fearful thought—appalling prospect to those constrained to sit at her cabin table! With it in their minds, the morning light brings no joy. Instead, it but intensifies their misery. For they are now sure they have no chance of being rescued. They sit haggard in their chairs—for no sleep has visited the eyes of either—like men who have been all night long engaged in a drunken debauch. Alas! how different! The glasses of wine before them are no longer touched, the fruits untasted. Neither the bouquet of the one, nor the perfume of the other, has any attraction for them now. Either is as much beyond their reach, as if a thousand miles off, instead of on a six-foot table between them! Gazing in one another's faces, they at times fancy it a dream. They can scarcely bring themselves to realise such a situation; as who could? The rude intrusion of the ruffian crew—the rough handling they have had—the breaking open of the lockers—and the boxes of gold borne off—all seem the phantasmagoria of some fleeting but horrible vision!

#### CHAPTER XLVI.—AN AWKWARD QUESTION.

The same sun that shines upon the abandoned barque lights up the crew that abandoned her, on the same spot where they have made landing. As the first rays fall over the cliff's crest, they shew a

cove of semicircular shape, backed by a beetling precipice. A ledge or dyke, sea-washed and weed-covered, trends across its entrance, with a gate-like opening in the centre, through which, at high tide, the sea sweeps in, though never quite up to the base of the cliff. Between this and the strand lies the elevated platform already spoken of, accessible from above by a sloping ravine, the bed of a stream running only when it rains. As said, it is only an acre or so in extent, and occupying the inner concavity of the semicircle. The beach is not visible from it, this concealed by the dry reef which runs across it as a chord. Only a small portion of it can be seen through the portal which admits the tidal flow. Beyond, stretches the open sea outside the surf, with the breakers more than a mile off.

Such is the topography of the place where the mutineers have made landing and passed the night. When the day dawns, but little is seen to betray their presence there. Only a man seated upon a stone, nodding as if asleep, at intervals awakening with a start, and grasping at a gun between his legs; soon letting it go, and again giving way to slumber, the effects of that drunken debauch kept up to a late hour of the night. He would be a poor sentinel were there need for vigilance. Seemingly, there is none. No enemy is near—no human being in sight; the only animate objects some sea-birds, that, winging their way along the face of the cliff, salute him with an occasional scream, as if incensed by his presence in a spot they deem sacred to themselves.

The sun fairly up, he rises to his feet, and walks towards the entrance of the larger cavern; then stopping in front of it, cries out:

'Inside there, shipmates! Sun's up—time to be stirring!'

Seeing him in motion, and hearing his hail, the gulls gather and swoop around his head in continuous screaming. In larger numbers, and with cries more strident, as his comrades come forth out of the cave, one after another, yawning, and stretching their arms.

The first, looking seaward, proposes to refresh himself by a plunge in the surf; and for this purpose starts toward the beach. The others, taken with the idea, follow in twos and threes, till in a string all are in motion. To reach the strand, it is necessary for them to pass through the gap in the transverse ledge, which the tide, now at ebb, enables them to do. He who leads, having gone through it, on getting a view of the shore outside, suddenly stops; as he does so, sending back a shout. It is a cry of surprise, followed by the startling announcement: 'The boat's gone!'

This should cause them apprehension, and would, if they but knew the consequences. Ignorant of these, they make light of it, one saying: 'Let her go, then! We want no boats now.'

'A horse would be more to our purpose,' suggests a second; 'or, for that matter, a dozen of them.'

'A dozen donkeys would do,' adds a third, accompanying his remark with a horse-laugh. 'It'll take about that many to pack our chattels.'

'What's become of the old pinnace, anyhow?' asks one in sober strain, as, having passed through the rock-portal, they stand scanning the strand. All remember the place where they landed, and left the boat. They see it is not there.

'Has any one made away with it?'

The question is asked, and instantly answered, several saying, no. Striker, the man who first missed it, vouchsafes the explanation.

'The return tide's taken it out, an', I dar say, it's broke to bits on them sheer breakers.'

All now remember that it was not properly moored, but left with painter loose; and do not wonder it went adrift. They care little, indeed nothing, and think of it no longer; but, stripping, plunge into the surf. After bathing to their hearts' content, they return to the cavern, and array themselves in garments befitting the life they intend leading. Their tarry togs are cast off, to be altogether abandoned; for each has a suit of shore clothes, brought away from the barque.

Every one rigged out in his own peculiar style, they draw together to deliberate on a plan of future action. Breakfast has been already eaten; and now comes the matter of greatest moment—the partition of the spoils.

It is done in little time, and with no great trouble. The boxes are broken open, and the gold-dust measured out in a pannikin; a like number of measures apportioned to each, round and round.

In money value no one knows the exact amount of his share. Enough satisfaction to feel it is high as much as he can carry.

After each has appropriated his own, they commence packing up, and preparing for the inland journey. And now arises the question, what way are they to go? They have already resolved to strike for the city of Santiago; but in what order should they travel? Separate into several parties, or go all together? The former plan, proposed by Gomez, is supported by Padilla, Hernandez, and Velarde. Gomez gives his reason. Such a large number of pedestrians along roads where none save horsemen are ever seen, could not fail to excite curiosity. It might cause inconvenient questions to be asked them—perhaps lead to their being arrested, and taken before some village *alcalde*. If so, what story could they tell?

On the other hand, there will be the chance of coming across Indians; and as those on the Veraguas coast are ranked among the 'bravos'—having preserved their independence, and along with it their instinctive hostility to the whites—an encounter with them might be even more dangerous than with any *alcalde*. Struggling along in squads of two or three, they would run a risk of getting captured, or killed, and scalped—perhaps all three.

This is the suggestion of Harry Blew, Striker and Davis alone favouring his view. All the others go against it, Gomez ridiculing the idea of danger from red men; at the same time enlarging on that to be apprehended from white ones. As the majority have more reason to fear civilised man than the so-called savage, it ends in their deciding for separation. They can come together again in Santiago if they choose it; or not, should chance for good or ill so determine. They are all amply provided for playing an independent part in the drama of their future lives; and with this pleasant prospect, they may part company without a sigh of regret.

Al! something yet: still another question to be determined. The female captives: how are they to be disposed of? They are still within the grotto, unseen, as the sail-cloth curtains it. Breakfast has been taken to them, which they have scarce touched; and the time has come for

deciding what has to be done with them. No one openly asks, or says a word upon the subject, though it is uppermost in the thoughts of all. It is a delicate question, and they are shy of broaching it. There is a sort of tacit impression, there will be difficulty about the appropriation of this portion of the spoils—an electricity in the air that foretells dispute and danger. All along it had been understood that two men laid claim to them; their claim, whether just or not, hitherto unquestioned, or, at all events, uncontested. These, Gomez and Hernandez. As they had been the original designers of the foul deed, now done, their confederates, rough men of a different stamp, little given to love-making, had either not thought about the women, or deemed their possession of secondary importance. But now, at the eleventh hour, it has become known that two others intend asserting a claim to them—one being Blew, the other Davis.

The mode of making their journey having been definitively settled, there is a short interregnum, during which most of those ready for the road stand idling, one or two still occupied in equipping themselves. La Crosse has been sent up the ravine, to report how things look inland. The four Spaniards have signified their intention to remain a little longer on the ground; while the three Englishmen have not said when they will leave. They are together conferring in low voice; but with an earnestness in their eyes, especially Blew's, which makes it easy to guess the subject. Only the theme of woman could kindle these fiery glances.

At length the dreaded interrogatory is put—and Gomez answers: 'They'll, of course, go with us—with Señor Hernandez and myself.'

'I don't see any of course about it,' says Blew. 'And more'n that, I tell ye they don't go with ye—leastwise, not so cheap as you think for.'

'What do you mean, Mr Blew?' demands the Spaniard, his eyes shewing anger, at the same time a certain uneasiness.

'No use your losin' temper, Gil Gomez. You ain't goin' to scare me. So you may as well keep cool. By doin' that, and listenin', you'll larn what I mean. The which is, that you and Hernandez have no more right to them creeturs in the cave than any o' the rest of us. Just as the gold, so ought it to be wi' the girls. In coorse, we can't divide them all round; but that's no reason why any two should take 'em, so long's any other two wants 'em as well. Now, I wants one o' them.'

'And I another!' puts in Davis.

'Yes,' continues Blew; 'and though I be a bit older than you, Mr Gomez, and not quite so pretentious a gentleman, I can like a pretty wench as well as yerself. I've took a fancy to the one wi' the tortoise-shell hair, an' an't goin' to gie her up in the slack way you seem to be wishin'.'

'Glad to hear it's the red one, Blew,' says Davis. 'As I'm for the black one, there's no rivalry between us. Her I mean to be mine—unless some better man hinders me.'

'Well,' interpolates Striker, 'as 'twas me first put the questyun, I s'pose I'll be allowed to gie an opeenyun?' No one saying nay, the ex-convict proceeds: 'As to any one hev'in' a speecial claim to them weemen, nobody has, an' nobody shed have. 'Bout that, Blew's right, an' so's Bill. An' since the thing's disputed, it oughter be settled in a fair an' square'—

'You needn't waste your breath,' interrupts Gomez, in a tone of determination. 'I admit no dispute in the matter. If these gentlemen insist, there's but one way of settlin'. First, however, I'll say a word to explain. One of these ladies is my sweetheart—was, before I ever saw any of you. Señor Hernandez here can say the same of the other. Nay, I may tell you more; they are pledged to us.'

'It's a lie!' cries Blew, confronting the slanderer, and looking him straight in the face. 'A lie, Gil Gomez, from the bottom o' your black heart!'

'Enough!' exclaims Gomez, now purple with rage. 'No man can give Frank Lara the lie, and live after.'

'Frank Lara, or whatever you may call yerself, I'll live long enough to see you under ground—or what's more like, hangin' wi' your throat in a halter. Don't make any mistake about me. I can shoot straight as you.'

'Avast theer!' shouts Striker to De Lara, seeing the latter about to draw a pistol. 'Keep yer hand off o' that weapon! If theer must be a fight, let it be a fair one. But, before it begin, Jack Striker has a word to say.'

While speaking, he has stepped between the two men, staying their encounter.

'Yes; let the fight be a fair one!' demand several voices, as the pirates come clustering around.

'Look here, shipmates!' continues Striker, still standing between the two angry men, and alternately eyeing them. 'What's the use o' spillin' blood about it—maybe killin' one the other? All for the sake o' a pair o' stoopid girls, or a kuppel o' pairs, as it be. Take my advice, an' settle the thing in a pacifical way. Maybe ye will, after ye've heerd what I intend proposin'; which I darsay 'll be satisfactory to all.'

'What is it, Jack?' asks one of the outsiders.

'First, then, I'm agoin' to make the observashun, that fightin' an't the way to get them weemen, whoever's fools enough to fight for 'em. Theer's somethin' to be done besides.'

'Explain yourself, old Sydney! What's to be done besides?'

'If the gals are goin' to be fought for, they've first got to be paid for.'

'How that?'

'How? What humbuggin' stuff askin' such a questyin! Han't we all equil shares in 'em? Coorse we have. Tha'for, them as wants 'em, must pay for 'em; an' they as wants 'em so bad as to do shootin' for 'em, surely won't object to that. Theer appear to be four candydates in the field; an', kewrous enuf, they're set in pairs, two for each one o' the girls. Now, 'ithout referin' to any fightin' that's to be done—an', if they're fools enuf to fight, let 'em—I say that eyther who eeventually gits a gal, shed pay a considerashin' o' gold-dust all roun' to the rest o' us—at the least a pannikin apiece. That's what Jack Striker proposes first.'

'It's fair,' says Slush.

'Nothing more than our rights,' observes Tarry; the Dane and Dutchman also endorsing the proposal.

'I agree to it,' says Harry Blew.

'I also,' adds Davis.

De Lara—late Gomez—signifies his assent by a

disdainful nod, but without saying a word; Hernandez imitating the action. In fear of losing adherents, neither dares disapprove of it.

'What more have you to say, Jack?' asks Slush, recalling Striker's last words, which seemed to promise something else.

'Not much. Only that I think it a pity, after our livin' so long in harmony thegither, we can't part same way. Weemen's allers been a bother ever since I've knowd 'em. An', I spose, it'll continue so to the eend o' the chapter, an' the eend o' some lives heer. I repeat, that it be a pity we shed hev to wind up wi' a quarrel wheer blood's bound to be spilt. Now, why can't it be settled 'thout that? I think I know of a way.'

'What way?'

'Leave it to the ladies theirselves. Gie them the chance o' who they'd like for a protector; same time lettin' 'em know they've got to choose 'tween one or tother. Let 'em take their pick, everybody unnerstandin' afterwards, theer's to be no quarrelin' or fightin'. That's our law in the Australyin bush, when we've cases o' this kind; an' every bushranger hes to bide by it. Why shedn't it be the same heer?'

'Why shouldn't it?' asks Slush. 'It's a good law—just and fair for all.'

'I consent to it,' says Blew, with apparent reluctance, as if doubtful of the result, yet satisfied to submit to the will of the majority. 'I maynt be neyther so young nor so good-lookin' as Mr Gomez,' he adds; 'I know I an't eyther. Still I'll take my chance. If she I lay claim to, pronounces against me, I promise to stand aside, and say neer another word—much less think o' fightin' for her. She can go 'long wi' him, an' my blessin' wi' both.'

'Bravo, Blew! You talk like a good un. Don't be afraid; we'll stand by you.'

This, from several of the outsiders.

'Comrades!' says Davis, 'I place myself in your hands. If my girl's against me, I'm willin to give her up, same as Blew.'

What about the other two? What answer will they make to the proposed peaceful compromise? All eyes are turned on them, awaiting it.

De Lara speaks first, his eyes flashing fire. Hitherto, he has been holding his anger in check; but now it breaks out, poured forth like lava from a burning mountain. 'Carajo!' he cries. 'I've been listening a long time to talk—taking it too coolly. Idle talk, all of it; yours, Mr Striker, especially. What care we about your ways in the Australian bush. They won't hold good here, or with me. My style of settling disputes is this, or this.' He touches his pistol-butt; and then the hilt of a *macheté*, hanging by his side, adding: 'Mr Blew can have his choice.'

'All right!' retorts the ex-man-o'-war's-man. 'I'm good for a bout with either, and don't care a toss which. Pistols at six paces, or my cutlass against that straight blade of yours. Both if you like.'

'Both be it. That's best, and will make the end sure. Get ready, and quick; for as sure as I stand here, I intend fighting you!'

'Say you intend tryin'. I'm ready to give you the chance. You can begin soon's you feel disposed.'

Hernandez hangs back, as though he would rather decline the combat.

'No, Bill!' says Striker; 'one fight at a time. When Blew an' Gomez hev got through wi' theirs, then you can gie Hernandez his change—if so be he care to hev it.'

Hernandez appears gratified with Striker's speech, disregarding the innuendo. He had no thought it would come to this, and looks as if he would surrender up his sweetheart without striking a blow. He makes no rejoinder; but shrinks back cowed-like and craven.

'Yes; one fight at a time!' cry others, endorsing the *dictum* of Striker.

It is the demand of the majority, and the minority concedes it. All know it is to be a duel to the death. A glance at the antagonists—at their angry eyes, and determined attitudes—makes this sure. On that lonely shore one of the two will sleep his last sleep; it may be both.

#### CHAPTER XLVII.—A DUEL ADJOURNED.

The combat, now declared inevitable, its preliminaries are speedily arranged. Under the circumstances, and between such adversaries, the punctilios of ceremony to be satisfied are slight; for theirs is the rough code of honour common to robbers of all countries and climes. No seconds are chosen, nor spoken of. All on the ground are to act as such; and at once proceed to business.

Some measure off the distance, stepping it between two stones. Others examine the pistols, to see that both are loaded with ball-cartridge, and carefully capped. The fight is to be with Colt's six-shooters, navy size. Each combatant chances to have one of this particular pattern. They are to commence firing at twelve paces, and if that be ineffectual, then close up, as either chooses. If neither fall to the shots, then to finish with the steel.

The captives inside the cave are ignorant of what is going on. Little dream they of the red tragedy soon to be enacted so near, or how much they themselves may be affected by its finale. It is indeed to them the chances of a contrasting destiny.

The duellists take stand by the stones, twelve paces apart. Blew having stripped off his pilot-cloth coat, is in his shirt sleeves. These rolled up to the elbow, expose ranges of tattooing, fouled anchors, stars, crescents, and sweethearts—a perfect medley of fore-castle souvenirs. They shew also muscles, lying along his arms like cording upon a ship's stay. Should the shots fail, those arms promise well for wielding the cutlass; and if his fingers clutch his antagonist's throat, the struggle will be a short one.

Still, no weak adversary will he meet in Francisco de Lara. He too has laid aside his outer garments—thrown off his scarlet cloak, and the heavy hat. He does not need stripping to the shirt-sleeves; his light *jaqueta* of velveteen in no way encumbers him. Fitting like a glove, it displays arms of muscular strength, with a body in symmetrical correspondence.

A duel between two such gladiators might be painful, but for all, a fearfully interesting spectacle. Those about to witness it seem to think so; as they stand silent, with breath bated, and glances bent alternately on one and the other.

As it has been arranged that Striker is to give the signal, the ex-convict, standing centrally outside

the line of fire, is about to say a word that will set two men, mad as tigers, at one another—each with full resolve to fire, cut down, and kill.

There is a moment of intense stillness, like the lull which precedes a storm. Nothing heard save the tidal wash against the near strand, the boom of the distant breakers, and at intervals the shrill scream of a sea-bird.

The customary 'Ready' is forming on Striker's lips, to be followed by the 'Fire!—one—two—three!' No one of these words—not a syllable—is he permitted to speak. Before he can give utterance to the first, a cry comes down from the cliff, which arrests the attention of all; soon as understood, enchaining it.

It is La Crosse who sends it, shouting in accent of alarm: 'Monsieur Blew! Comrades! *We're on an island!*'

When the forest is on fire, or the savannah swept by flood, and their wild denizens flee to a spot uninvaded, the timid deer is safe beside the fierce wolf or treacherous cougar. In face of the common danger they will stand trembling together—the 'beasts of prey for the time gentle as their victims. So with human kind; a parallel being furnished by the pirate crew of the *Condor* and their captives.

The former, on hearing the cry of La Crosse, are at first only startled. Soon their surprise changes to apprehension; keen enough to stay the threatening fight, and indefinitely postpone it. For at the words '*We're on an island,*' they are impressed with an instinctive sense of danger; and all, combatants as spectators, rush up the ravine, to the summit of the cliff, where La Crosse is still standing.

Arrived there, and casting their eyes inland, they have evidence of the truth of his assertion. A strait, leagues in width, separates them from the mainland. Far too wide to be crossed by the strongest swimmer amongst them—too wide for them to be descried from the opposite side, even through a telescope! The island on which they have beached their boat is a mere strip of sea-washed rock, running parallel to the coast, cliff-bound, table-topped, sterile, treeless; and to all appearance, waterless!

As this last thought comes uppermost—along with the recollection that their boat is lost—what was at first only a flurry of excited apprehension, becomes a fixed fear. Still further intensified, when after scattering over the islet, and exploring it from end to end, they again come together, and each party delivers its report. No wood save some stunted bushes; no water—stream, pond, or spring; only that of the salt sea rippling around; no sign of animal life, except snakes, scorpions, and lizards, with the birds flying above—screaming as if in triumph at the intruders upon their domain being thus entrapped! For they are so, and clearly comprehend it. Most of them are men who have professionally followed the sea, and understand what it is to be 'castaways.' Some have had experience of it in their time, and need no reminding of its dangers. To a man, they feel their safety as much compromised as if the spot of earth under their feet, instead of being but three leagues from land, for such it seems, were three thousand; for that matter, in the middle of the Pacific itself! What would they not now give to be again on board the barque sent sailing thither to miserably sink?

Ah! their cruelty has come back upon them like a curse!

The interrupted duel—what of it? Nothing. It is not likely ever to be fought. Between the *ci-devant* combatants, mad anger and jealous rivalry may still remain. But neither shews it now; both subdued, in contemplation of the common peril, Blew apparently less affected than his antagonist. But all are frightened—awed by a combination of occurrences, that look as though an avenging angel had been sent to punish them for their crimes!

From that moment Carmen Montijo and Inez Alvarez are safe in their midst as if promenading the streets of Cadiz, or flirting their fans at the successful matador. Safe, as far as being molested by the ruffians around them. Yet, alas! exposed to the danger overhanging all—death from starvation.

But surely some means will be discovered to escape from the island? Or, remaining upon it, a way to sustain life? Questions asked and hopes indulged in, that, as the days pass, prove delusive. Not a stick of timber out of which to construct a raft. Nothing for food, save reptiles on the land and shell-fish in the sea—these scarce, and difficult of collection. Now and then a bird, its flesh ill-favoured and rank. But the want above all—water! For days not a drop is obtained, till their throats feel as if on fire. Plenty of it around—too much. But it is as with Tantalus. The briny deep, they may touch, but not taste. It makes them mad to gaze on it; to drink of it would but madden them the more.

A fearful fate now threatens the crew of the *Condor*, in horror equalling that to which those left aboard of her have been consigned. Well may they deem it a retribution—that God's hand is upon them, meting out a punishment apportioned to their crime! But surely He will not permit the innocent to suffer with the guilty? Let us hope, pray, He will not.

#### BARTLEY'S KNOWLEDGE PAPERS.

WHILE engaged in diffusing such information on miscellaneous subjects as might help to strengthen the good resolutions and enlarge the intelligence of the less affluent, or, we might rather say, the less educated classes in the community, it has always afforded us pleasure to see others engaged in the same cause, and to wish them all possible success. The latest effort of this kind that merits approbation is that made by an association in London, designated the *Provident Knowledge Society*, whose professed object 'is to endeavour to make regular weekly saving a national habit, and so to increase the facilities for saving, that it shall be as easy for a man to put by a small sum, as it is now for him to spend that sum in beer or spirits.' A high aim, certainly, and one cannot but feel curious to know what will be the practical result. The Society appears to work in two ways. Through its honorary secretary and treasurer, G. C. T. Bartley (112 Brompton Road), it offers every assistance by letter or personal advice as regards 'forming schemes to encourage frugality;' and the same indefatigable secretary, with a devotion which we cannot but admire, has written and issued a series of penny manuals,

called the *Provident Knowledge Papers*, of which we desire to say a few words, for the purpose of making them perhaps better known than they happen to be.

Mr Bartley takes a new method in addressing the classes of persons for whom his papers are intended. He uses no sentiment; does not dwell abstractly on the value of saving; is not the least of a rhetorician. He is neither an essayist nor a platform orator, but goes to the point at once, by giving distinct directions what to do, and what to abstain from doing. Assuming that there is a prodigious want of knowledge on many plain but important matters of fact—and in this he is quite right—he takes up subject after subject, and tells all that needs be known about it. For example, a man in humble life has a vague notion that he would like to save some of his weekly earnings in order to secure a pension in his old age. But he does not know how to set about it. There is no one to put him on the right track, unless, perhaps, it be the minister of the parish or some good-natured neighbour, who will take a little trouble in the matter; and even, after all, the required information may be incomplete or not quite satisfactory. Well, here, for a single penny, the inquirer gets every particular he wants with official precision. He is told what can be done for eightpence a week. 'For that sum, paid from the age of nineteen to sixty, any man may obtain a pension of five shillings a week for the remainder of his life, on government security. For fourpence a week, paid during the same period, he may buy a pension of half-a-crown a week, and more or less in proportion. But it will be said, and justly, that as life is uncertain, it may be that a man beginning to put by at nineteen may never live to be sixty; what then becomes of all he has paid into the post office? The answer is, it is paid to whomsoever he may direct. Thus, if he died at forty, about L.35 would be returned; if he died at fifty, about L.52 would be returned; and so on. The money may even be taken out during illness.'

So much for the first number of these papers. The second refers to Life Insurance, the various plans for effecting which are minutely explained with reference to the payment of a sum at death to survivors; in this, as in the preceding case, the forms of letters to be used in application being given. As a sort of supplement to these papers, the third paper consists of easy tables for calculating what a few pence a week will do. The fourth paper is on 'Penny Banks,' and how to start them in every village and manufactory; and the fifth refers to the setting up of Penny Banks in schools. Some good hints are casually offered as to teaching children to be thrifty. 'With this end in view, it is strongly urged upon the managers of elementary schools, and on all who really believe in the blessings which an extension of provident habits would secure, to lose no time in opening penny banks in all schools, and thus practically to help forward the cause of frugality and provi-

dence throughout the length and breadth of the land.' People need not be afraid of making children penurious; the great thing is to teach them the value of money with a view to proper ends, instead of letting them squander it on the trash in which they are apt to indulge.

Passing over several papers on Savings-banks, and Interest and Security, we come to one eminently practical and useful regarding Pawnbrokers. The whole *mécanique* of pawnbroking is given, and terrible examples mentioned of the loss incurred by persons who seek to relieve domestic difficulties by a habitual recourse to the pawnshop. We would here just say, that we cannot join in any indiscriminate onslaught on the pawnbroking system. It no doubt often saves a family from misery; in numerous instances, it may save the desperate from falling into crime or the loss of character. At the same time, it encourages improvidence, and is a fatal resource, concerning which the heedless should be thoroughly made acquainted. The tract on this subject could hardly be too widely circulated in large towns. We may give a few of the explanations.

'For all loans of forty shillings and under, a fixed scale is made as follows: For any time during which the pledge remains in pawn, not exceeding one month, for every two shillings or fraction of two shillings, one halfpenny. For every month after the first, including the current month in which the pledge is redeemed, although that month is not expired, for every two shillings or fraction of two shillings lent, one halfpenny. For the pawn-ticket a fee has to be paid of one halfpenny, for a loan of ten shillings or under; and one penny if it be over ten shillings. The pawnbroker is entitled to take half the amount above stated for interest, if the pledge is redeemed within fourteen days.' These charges do not appear very high, but though they seem trifling, they in reality amount to enormous sums, and the interest is very great. For a loan of two shillings the interest and the cost of the pawn-ticket together make the charge for the month not less than at the rate of fifty per cent. per annum. Every subsequent month the interest is at the rate of twenty-five per cent. For loans under two shillings the charge is the same as for two shillings. The interest is, therefore, proportionally more. For a loan of one shilling, the charge for the first month is at the rate of one hundred per cent., and for subsequent months fifty per cent. For a loan of sixpence—and this is not an uncommon pawn on such things as flat-irons, saucepans, &c.—the cost for the first month is at the rate of two hundred per cent.; that is, the charges will swallow up the whole loan in less than a year.'

As to the extent of the pawnbroking system—'It is estimated that about two hundred and seven millions of pledges are taken out each year. If all were redeemed within the first month, and none of them exceeded two shillings in amount, the interest which the people pledging would be called upon to pay would amount to the enormous sum of eight hundred and sixty thousand pounds per annum. As a matter of fact, however, it seems probable that the average amount paid for each pledge is nearer

sixpence, if not above that sum. If this be so, for interest on money lent to the poorest persons in the kingdom, a sum of money is paid by them as interest to the pawnbrokers annually of upwards of five millions sterling! Advice offered: 'Every sensible man should give up visiting those houses with the sign of the Three Golden Balls, and with the aid of the savings-bank, or some penny bank, become his own pawnbroker.'

Our author does not seem to be aware that there may be a worse kind of pawning than that which is regulated by statutory enactment. Has he never heard of what, in Scotland, are called 'wee pawns?' They consist of obscure resorts of the marine-store-dealing order, where petty articles are purchased on the understanding that they will be bought back in a day or two. No tickets are given, and no books kept. The person so selling or pawning will sometimes pay as much as at the rate of a thousand, even two thousand per cent. per annum. For example, a smoothing-iron will be sold for twopence (wherewith to get a dram), and purchased back next day for threepence or fourpence. And so on with other articles—bedding, spoons, petticoats, &c. In virtue of local police acts, strenuous exertions are made in Edinburgh and some other cities, to stamp out these pestilent establishments. They are spreading, however, without challenge in the smaller country towns, where they cannot well be reached at common law, and afford a sorrowful proof of that want of frugality which it is the object of the Provident Knowledge Society to remedy.

One of Mr Bartley's later papers is addressed to female domestic servants, with advices as to dressing, and what can be done by a quarterly visit to the savings-banks. Another paper gives seasonable hints to governesses and clerks with regard to what may be accomplished by good management. We have seen nothing more rational or better adapted to the end in view than these various papers. The question, however, remains, will people read them? They, at all events, put the matter so clearly and simply that there is no longer an excuse on the ground of not knowing what to do to avert the possible ills arising from misexpenditure. The trouble thus taken to instruct and promote moral elevation by individual self-restraint, contrasts pleasingly with the wild dreams of those who look too exclusively for social regeneration to legislative enactment. On this latter point we might expatiate at some length, but shall content ourselves with a single reminiscence. We remember being told by the late Lord Murray (the friend of Jeffrey, Brougham, and Sydney Smith), that 'in his young days, early in the present century, no man was considered a gentleman who entered the boxes of a theatre or a ballroom sober. To sustain his character as a gentleman, it was absolutely necessary for him, even in the estimation of ladies, to be to a certain extent tipsy. At that time the humbler were the sober classes, because they had not money to spend to any extent on drink. And now,' added his lordship, 'see what a change has taken place—among the refined, perfect sobriety; and drunkenness entirely confined to the least educated part of the community.' As this change has come about spontaneously, through the gradual improvement of manners and tastes—not by bills in parliament—we may reasonably hope that, by the like

quiet agencies, and diffusion of knowledge, the lower will in time emulate the higher classes of society. In this direction all Mr Bartley's papers significantly tend. W. C.

## FLITTERMOUSE WELL.

## IN TWO CHAPTERS.—CHAPTER I.

THE manuscript which I here transcribe came into my possession accidentally, and in a rather curious way; and as I think it may prove interesting to some readers of this *Journal*, I have copied it for publication. The manner in which I became possessed of it is simply as follows. Last autumn I hired a farm-house in an obscure part of the south coast for the shooting season. Dunmoor Manor, as it was called, was gloomy, dilapidated, and unprepossessing in appearance. It had been long untenanted; the people of the surrounding neighbourhood being, for some reason, prejudiced against the place. It suited my purpose, however. I had it comfortably furnished, and the bachelor friend who came down to share my quarters and my sport was pleased to approve of the antique aspect of the rooms, which I had left unviolated by the touch of any renovating hand. It was whilst I— and I were examining the old-fashioned wainscoting of what I had made my smoking-room, that we discovered a recess in the wall, closed in by a clumsily sliding panel, from which we drew forth the document which is now in my possession. It was much discoloured, and covered with dust and cobwebs; and we could with difficulty decipher the cramped and faded handwriting; but the following is a correct transcript of its contents.

From a child, I was always imaginative. Darkness would suggest to me the strangest phantoms. The steep hillside which frowned upon my home seemed to me a mighty giant; the dark clouds, which swept across the heavens, fierce monsters. I delighted in creating fanciful shapes out of the gloamin, when, in long winter evenings, I sat in the deep window-seat, watching the swaying of the sycamore branches, and listening to the dreary sighing of the wind among the leaves. Perhaps the tendency was increased by the lonely life I led, and by the total lack of companionship with boys of my own age.

Mine was the old story of a craving for education, where education was out of the question. Every book that remained of my grandfather's library I had read again and again, poring each time with fresh excitement over the history of adventures, probable and improbable, therein contained. I had many opportunities of gratifying my morbid tastes, for my grandfather cared little how I passed my days. His life had been a more checkered one than I in my youth suspected, and was now drawing near its end; as far as any active business was concerned, it had ended. There remained to him now but to wait in patience by his fireside until the day should come when he should be called upon to lay aside his burden. As for my Aunt Barbara (the only other inmate of the house, save Deborah the old servant), her days were passed in one long sad retrospect; her eyes seemed ever to be looking far away into the past, her voice sounded muffled and low, and her step

was like the traditional ghostly footstep that haunts a deserted corridor. With such uncongenial companions, what wonder that I fell back upon my own resources.

My chief diversion was in wandering about the country; my best friend being the dreary hillside, a moonlight ramble my keenest enjoyment. Often at midnight, I used to creep out of the ivied casement of my little room, and roam up to the dark pine-woods, and along the crest of the hill, where the tufted juniper bushes crop out of the deserted chalk-pits, and in the daytime, the daws congregate and chatter to their young. If any of the household knew of these nocturnal excursions, they, at anyrate, did not trouble themselves to put a stop to them.

This was my life from a child. In my earliest recollections my home was the gable-ended manor-house, fast falling into decay, flanked by the long lines of tall yew hedges, which darken the windows with their gloomy intensity. The sighing of the wind in the sycamore trees was the first sound that ever fell on my ears, and it is likely to fall on them on the day of my death. The seclusion of our existence may be better imagined when I mention that the nearest village was five miles distant, and that there was no proper road of communication between it and us. Fields and woods lie before the house, the hill rises behind it, and on the right the gray moors stretch out for about two miles, where they terminate abruptly in high cliffs, washed at the base by the restless waves of the sea. Strange to say, those cliffs, and the shore beneath them, though so near, were unknown ground to me. I was familiar with the hillside, and with the country for miles round, yet I never dared to venture near the sea. The reason for this circumstance it will take me some time to explain.

Years ago, in my early childhood, a race of men infested these shores who were the scourge of all the country round. They were called smugglers; but they were very different from the smugglers we hear of in these days, who now and then hide a keg or two of brandy, or a few bales of lace, in some secret nook along the coast. The smugglers of my grandfather's time much more resembled bandit robbers, only that their stronghold, instead of being the depth of the forest, was the open sea; for, not content with secreting contraband goods in the caves with which these cliffs abound, they made raids into the country, plundering the homesteads, and even pressing the farmers' sons into their service. As was natural, these aggressions stirred up the strongest and most bitter animosity in the hearts of the landmen; and many were the struggles which took place in those days upon cliff and shore, with varied result, and sometimes with loss of life on both sides.

My grandfather was a man capable of strong feelings of revenge. His farm had been plundered more than once, and all that he most valued carried away; and he vowed vengeance on the men who had despoiled him. Now it is that I come to the darkest page in his life. He had always been considered a harsh, stern man in his own household. It is reported that his wife pined away through ill-treatment, and of the three sons she had borne him, two had come to a bad end. The third lived at home for a time, and I believe my grandfather to have been, in his stern way, much attached to him. When still quite young,

however, this son offended him, by marrying otherwise than had been intended; and for about a year he and his young wife had a hard life of it. At the end of that time, the father and son came to an open rupture, and the latter fled, no one knew whither. When next he was heard of, it was as one of the smuggler gang.

My grandfather never got over the shock these tidings gave him. That his son, his only remaining son, should have joined the robbers and plunderers of his country, was more than he could bear. But if his heart was wounded, the old man's passions were roused. He would hear of no extenuating circumstances, he would not allow the possibility of his son's having been pressed into the smugglers' gang, or that his own harshness and severity had led to this end. 'Only let him land with his ill-gotten gains upon this coast,' he was heard to say, 'and he and his wretched associates shall know that there is vengeance in the land. He has chosen a smuggler's life—let him die a smuggler's death.'

Upon a certain night the smugglers came again to deposit their stores in the caves, and the landmen were there to meet them. Then ensued a combat between desperate men on both sides—men who had ceased to regard the laws of God or man on the one hand, and men rendered savage by the desecration of their homes and the loss of their property on the other. It was a wild and stormy night; but the fierce waves which dashed themselves against the shore were less turbulent than the fierce passions which raged in the hearts of the combatants. Many fell in the struggle; the precipitous cliffs found some victims; some were drowned, others wounded. My grandfather was in the thickest of the fight; and among the bodies identified was found that of his son Everard; a bullet had pierced his heart. They say that bullet was aimed by my grandfather, and that he knew at whom he was aiming! Heaven knows if this be true! I know only that Everard Roche was my father, and that my mother died in giving birth to me at the manor, after hearing the result of that night's work.

From that time, my grandfather is said to have grown more morose, more stern; and from that time also his prosperity deserted him. The farm was given up, and the farm buildings allowed to fall to ruins; one by one, the old man had to part with all the heirlooms long preserved (for our family dates back many generations). Yet he still continued to watch for the smugglers, and to plan further revenge upon them, until old age came upon him suddenly and unawares, and he became the helpless and infirm creature that I remember him.

As for me, an orphan and unloved, I grew up in that dreary household, as I have said, uncared for, yet treated with no harshness, and with only the one command laid upon me from my earliest years (and that under the threat of my grandfather's curse, if I disobeyed him)—namely, that I should never whilst he lived set my foot upon that shore where my father found his death. I was kept in ignorance of the reason for this prohibition for many years, but I obeyed it. Never once did my feet venture to the edge of Dunmoor Crags. The cliffs and the sea were alike unknown mysteries to me; I never rambled on the shore, I never bathed or waded in the waves.

Long ago, before my grandfather had ceased to pass beyond these tumble-down gateways, and when I was but a little child, I can remember going with him over the hill to Blackness Farm, where he would confabulate for hours with its tenant, Farmer Horwood; and as I stood by watching them, I used to see my grandfather point to where, in the distance, the gray rolling sea heaved angrily beyond the dark crag, whilst a fierce look, not pleasant to see, would come into his face. I did not understand the meaning of this; but from that time a growing fear and dread of the sea-shore became rooted in my heart, which perhaps I have never quite overcome.

Farmer Horwood was our nearest, almost our only neighbour. His farm lay at about two miles' distance from the manor, but as it was on the other side of the hill, the distance seemed greater than it really was. There was very little communication between the two houses, now that my grandfather was so infirm. Only occasionally the farmer, who joined with my grandfather in his hatred of the smugglers, would ride over on his way to the market-town of G—, and give the last tidings of our enemies. He would, I believe, have welcomed me to his house, had I been willing to go; but as a child I had acquired an unaccountable aversion to his daughter Janet. In the days when I went with my grandfather to Blackness, and Janet Horwood would invite me indoors, and give me cakes, or clotted cream, even these dainties failed to win me, and I shrank from her dark eyes as they rested upon me, and disliked the sound of her cold voice inviting me in. Yet the girl was respected by all who knew her, and had a reputation for piety. Twice every Sunday she rode to chapel on her father's brown cob. I have often heard her singing hymns over her work as she ordered her father's house, with her usual neatness and decorum.

Having entered into these long explanations, I may now resume my narrative.

I was about fourteen when the events which I am about to describe took place, events which had such effect upon my after-life. At this time, my mind, always imaginative, had arrived at a pitch of morbid sensibility difficult to describe. I continued to indulge my fancies in those midnight rambles which I have before alluded to, and they afforded me a strange kind of excitement and pleasure. Often on dark nights I would fancy that I saw weird, unearthly objects flitting among the pines, or groups of spectre horsemen scouring the plain. At times, I even gave chase to these imaginary phantoms, inspired with an insane desire to discover whether they were real or not. The moon gazing quietly down from the heavens often beheld me chasing these shadows. Human eye to see there was none.

Among all the haunts in which I delighted, the place with which was associated the greatest amount of excitement and interest was Flittermouse Well. Strange stories there were of a gray ghost haunting this well, and there was said to be a passage of communication between it and the caverned shore, where the smugglers had in time past taken refuge, or even found means of escape. It is an innocent-looking place enough in the daytime; at night, it is an ugly pitfall. Why it is called a well, as there is no water in it, I cannot

say, or who gave it the name it has borne ever since I remember it. A large willow tree overhangs it, and sometimes I held on to its gnarled roots, and peered down, fancying I could hear strange noises in its inmost recesses; but it was more than I dared to do to risk the descent. Flittermouse Well's depth was unknown to me, as, owing to the shadow of the tree, and the roots twining round its mouth, it was in perpetual darkness; but the pebbles I threw in sounded faintly, as, after a long pause, they reached the bottom; and by that I guessed that it was very deep. It must be nearly a mile from the shore, yet I used to think I heard the faint splash and murmur of waves, when I hung over it devising means of descent. Strange in my desire, I had pondered over ways of descending it till I was tired, and at last, in despair of ever succeeding, had discontinued my visits to it; when one night the circumstance I am about to relate attracted my attention to it again.

First, however, let me say a few words as to the position of the well. When you have climbed the hill from the manor, you turn to your right; before you, lies a pine-wood, and beyond it the large tract of waste land lying along the hill-top, and called by countrymen 'Ninety Acres.' This tract is bounded on one side by a wood, and on the edge of this wood, at the old willow, is Flittermouse Well.

I had escaped from my bedroom window as usual one night, and having clambered up the hill by the great chalk-pit, found myself over against the well. I was looking in that direction when I fancied I saw the glimmer of a light. It disappeared, however, so quickly that I almost doubted my own eyes, and to make sure, I walked straight across the moor towards the wood. I saw no more of the light, and had made up my mind that my eyes had deceived me, when, as I neared the edge of the wood, I saw distinctly a tall gray figure glide past me in the moonlight, and disappear in the shadow of the trees. This I felt assured was no fancy, so I spent some moments in the pursuit of the figure, but no further trace of it could I see. I then sprawled down at the brink of the well, and peered over its edge. All was as dark as usual, but I heard a rattling, as of displaced earth, and then a dull echoing sound, which grew fainter and fainter, and finally died away. I next groped with my hands all round the edge of the well, but found all as usual, and no signs of any disturbance. My easily excited brain now began to conjure up the wildest fancies. That I had seen the 'gray ghost,' I had not the smallest doubt, and at all hazards I determined to see the phantom again; but I was not destined to do so that night; and after anxious watching, I was obliged to return home.

Next morning, I rose early, and came once more to the well; but I saw only the willow branches waving over it as usual, and heard but the sighing of the wind as it shivered through the leaves. There were no footprints, no traces of any intruder. But that night my watching was rewarded. This time I was more cautious, and hid myself behind a juniper bush near the spot. Presently a light glimmered. Excitement nearly choked me, as, instead of disappearing as before, the well seemed illuminated, and faint rays streamed far and wide over the grass. Shadows also played over the willow

boughs—shadows thrown, as I deemed, by no earthly forms. At length I drew cautiously near; but ere I had reached the well's mouth, the light vanished, and again a gray figure passed me in the moonlight, and disappeared in the shadow of the wood.

After this, insatiable curiosity drew me each night towards this haunt. Sometimes I fancied I could descry two figures; sometimes, when I gazed down the well, rays of light shone from its inmost recesses, enabling me to see into its mysterious depths. I then saw that it was perilously deep, and that the bottom of it shelved down on one side to what appeared to be a passage. It was from this deep passage that the light seemed to shine. All these circumstances, and the absence of any trace of human interference, strengthened my belief in the supernatural tenants of Flitter-mouse Well.

I kept all my discoveries strictly to myself, and positively revelled in them. 'I will find out more yet,' I thought; 'I will brave the phantom, and compel it to disclose to me the mysteries of its existence.'

I can well recall myself to mind as I was then—a haggard wild-looking boy, pale and attenuated with keeping night-watches, when I should have been enjoying the healthy sleep of childhood, crouched down, as well as my awkwardly long limbs would allow, with my hands clasped round my knees, and my long black hair hanging over the ever vigilant eyes which kept guard over the secret of the well.

Time passed, and the monotonous life of our household at the manor went on much as usual, and my mind was ever full of the excitement of my nightly adventure. I remember noticing, however, about this time, that one or two yeomen from neighbouring homesteads came to the manor, and that on these visits my grandfather roused himself a little from his usual apathy; and after they were gone, he sat muttering half-incoherently, as he gazed into the red embers from his arm-chair by the hearth. After one of these visitors had come and gone, I was commissioned to carry a letter over the hill to Farmer Horwood. It was of importance, so my aunt informed me, and I was on no account to delay or loiter on the way.

When I arrived at Blackness, Janet Horwood was busy as usual in the kitchen; but this time she was not singing hymns, and her face, as she turned and saw me, wore a look which I had never seen on it before. It was a vindictive look, and one which sent an unpleasant chill to my heart. I explained my errand, which was to deliver the letter to the farmer himself; and instead of inviting me in, as was her custom, she left me standing at the door, and hurried away without a word. Her face was pale, and her lips compressed; and I was wondering whether she were ill, when she presently returned, and beckoned to me, still without speaking, to follow her. I followed, through the kitchen and along a dim white-washed passage, till we reached a musty room, where sat Farmer Horwood at his desk with pen and papers before him. I gave him the letter, and the message which accompanied it, and stood by whilst he read the former. When he had read it, he threw it down, and struck his fist violently on the desk. 'At last,' said he, 'those villains shall be served as they deserve! I have not forgotten the day when

this house was broken into, or when the two best horses in my stable were stolen, to furnish means of escape to the wretches, when hard pressed. Thank goodness, I am not too old or decrepit to have my share in their just punishment.'

He seemed to be speaking more to himself than to us; but I heard what he said, and so did Janet, for her face grew still paler, and she drew near her father and touched his arm.

'The smugglers! O father, there is not going to be another attack on them?' she cried in a tone of great alarm. 'Surely we have been avenged enough. They have been quiet lately.'

'Pshaw! nonsense,' said the farmer, rising hastily, on being reminded that he had spoken aloud; then, as Janet was about to speak again, he pushed her roughly to the door with a gesture of impatience. 'Peace, girl!' said he; 'what do women know of such things. You had better mind your own work.'

Thus summarily ejected, we found ourselves once more in the white-washed passage; when Janet took me by the arm, and gazing into my face with a glance full of scornful anger, she said in a low voice: 'Boy, beware how you meddle with other folks' matters! It leads to no good, and your fooleries may be the ruin of those worth more than you.' With a look that emphasised her words, she turned towards a dark staircase, leaving me to find my way out of the house as best I could.

#### MANAGEMENT OF CHILDREN.

ALTHOUGH of making medical books there is no end, we do not remember to have seen hitherto any work treating of the physical wants of children which would serve as a popular handy-book on the subject, and be easily understood by mothers of the poorer class. At length has appeared a valuable treatise, by Dr Barker of Brighton, on the *Management of Children in Health and Disease*. Dr Barker's style of writing is at once concise and minute, his language simple, and arrangement clear. In the chapters on Diseases and Ailments, we may especially commend his various tables comparing the symptoms of complaints liable to be mistaken for each other, as of scarlatina and measles, inflammation of the lungs and bronchitis, chicken-pox and modified small-pox. In these tables are set down the minute points of distinction between the disorders severally, a knowledge of which would often relieve much anxiety, and spare the sufferer the infliction of wrong treatment.

It is worth while to regard for a moment, in wonder, the fanciful treatment undergone at this day by the children of those who belong to an enlightened order. Mrs Buckton, in her interesting lectures on Health, delivered at Leeds, can tell us how babies are dosed with castor-oil, or stuffed with sugar and butter, before they are a day old; how they have the bones of the head pressed, in order to improve the shape; how their scalps are left unwashed, lest the water should run through to the brain, and smothered in wraps at night, from fear of cold; how their bodies are bandaged into wrinkles, their arms not seldom put out of joint by being dragged, and their hips

sometimes painfully diseased from their being put down on damp and cold places. At a year old, such an infant will breakfast on bacon and raspberry tea, and dine on bread and butter, or potatoes washed down by a sup of gin. Knowing these things, we need not wonder that nearly half the number of deaths in the kingdom are those of children under five years of age, or that for every rich man's child that dies, poor men lose three.

Beginning, then, at the first age of man in the nurse's arms, our author gives plain directions for handling and washing an infant; warning mothers against the use of cold bathing as a means of hardening delicate children, and telling them, what they do not commonly know, that sea-water is as powerful an agent in producing colds as fresh water. He tells them, too, that their children are often too slenderly clad, save about the head, which alone should be cool, and covered with the lightest gear unburdened by a particle of lining. Woollen socks with wash-leather pads should be substituted for the cold comfort of cotton socks and morocco shoes, and generally a little more care than is usually bestowed on children's boots and shoes would save many an ache and pain. Respecting food, the following small points are worth noting by mothers and nurses. An infant should not be thought to want food whenever it cries; it should not be allowed to suck its fingers or an empty bottle, for the saliva thereby promoted, finding its way into the stomach, causes positive ailments, besides blunting the sense of hunger for proper food; a spoon should not take the place of the bottle, the act of sucking, like mastication, being the first step in the digestion of food; meat is unnecessary, and even prejudicial to an infant before the appearance of its teeth; sugar, on which West Indian babies grow plump and sleek, ought to be given in puddings, but the currants in buns must, alas! be classed among forbidden fruit.

For children, a wine-glassful of good beer at dinner will often stimulate a flagging appetite, though Dr Barker thinks it a mistake to suppose that any kind of beer contains a single grain of true nourishment. This portion of the book is closed by a long list of children's Foods, with an account of their composition, and detailed particulars of their preparation for use. Then the young mother is advised to put her child to bed without nursing or rocking, and to lay it as much on one side as the other; as she values its life, to eschew all such abominations as composing-powders and soothing syrups, those 'charms of powerful trouble;' not to carry it on the same arm, or lead it on the same side always; to guard against its exposure to east wind; and to forbid her growing girls to lie on their backs for long periods—a practice hurtful to muscle and bone. Then follows a chapter on Exercise and Amusements, in which something new—almost startling—is boldly advanced. Toy whips should be withheld, Dr Barker thinks, as being suggestive of cruelty; and certain old favourites, such as leap-frog, giant-strides, and paper-chases, are pronounced to be decidedly dangerous amusements. Rink-skating is described as one of the most healthful and useful of all recreative activities for men, women, and children, invigorating the body, stimulating the mind, and strengthening the intellect. It wards

off consumption, improves the figure, and does good in every way. Our girls are recommended, too, to carry bags of beans, sand, or pebbles, poised on the head, in order to become upright and graceful, and not to let the tyranny of custom preclude them from their brothers' games of quoits, bowls, tennis, or cricket. Home gymnastics, or a mere hand-swing suspended from the ceiling, will prove an effectual remedy against narrow chests and crooked spines.

From recreation, our author now passes to Education, not unmindful, as Robert Burton puts it, that 'if a man escape a bad nurse he may be undone by evil bringing-up.' Cheap boarding-schools are a delusion, good nourishment being incompatible with low fees; and ladies' schools for boys if tutored by men ought to be avoided. Dr Barker has extraordinary views on the uselessness of teaching boys the dead languages, the acquisition of which, he thinks, 'not seldom leaves a man something of a savage, with many fine qualities repressed probably, and the mental powers groove-like and contracted.' But here we must express our dissent from such wholesale condemnation of classical teaching, for to withhold from young folks a knowledge of that splendid literature in its own tongue, 'from which,' says Macaulay, 'has sprung all the strength, the wisdom, the freedom, and the glory of the western world,' would often be the means of nipping in the bud a love of letters, which might blossom into much usefulness and pleasure in after-life. For a certain period, the aim of the teacher should be to enlarge and enrich the mind of the pupil, without having too much in view the particular career for which the boy may be destined, and 'since custom is the principal magistrate of man's life,' to invite him to mental exercise on works which are the storehouses of every modern creation of the intellect.

There is much sense in the doctor's remarks on the fallacious cravings after 'the professions,' whose followers too often find nothing but ignominious poverty therein; and on the unconsidered choice of occupations by parents, who, as a rule, never consider their sons' physical fitness for habits of life inseparable from certain callings. With the passages, original and quoted, on the education of girls, we can in a measure agree, 'The system as it now exists is evidently faulty, in seeming to consider only the youth of woman, and aiming at embellishing her first few years—themselves full of beauty and grace—instead of giving her resources that will endure as long as life, and render her dignified and useful; the mind is ill trained, ill regulated, and neglected, regardless of riper age, and leaving it weak, purposeless, a miserable prey to idleness and insignificance, as if, when no longer young, and her short-lived bloom of beauty is over, she should cease to exist, or expect regard. . . . Girls are trained too much with reference to present display of their acquirements in a drawing or ball room, and merely for society and marriage.' Most true, we fear, is all this, and we would ask the mothers who thus train their daughters, if marriage be the only worthy aim of woman's life, why is she not systematically taught the simple things that a mistress of a household ought to know, such as the management of servants, and the care of children, the use of common medicines, and the art of nursing, and the little ways and means that tend to comfort and

economy? Without having in view the prospect of domestic service themselves, our young ladies would surely prove all the better mistresses if they were taught the practical duties of servants: such as, for instance, how to manage a baby, make a bed, clean a room, and serve up a dinner. Great, we believe, would be the physical and moral gain to be derived from such training, which would not be devoid of interest, and even amusement. It would indeed be well that our wives should have had, when young, some teaching which would enable them to look well to the ways of their households.

The remaining half of Dr Barker's book, which is taken up with the consideration and treatment of the ills that children's flesh is heir to, is especially well done. Here are pointed out the earliest indications of disease, the right application of household remedies as a preliminary measure in the doctor's absence, and some hints on nursing sick children, which should not be slighted as trifling. There are hints upon the nurse's dress, which should neither be of rustling silk nor severely plain; the habit of keeping memoranda for the doctor's information; the dislike which sick children have to be stared at; the necessity of quiet during their meals; the worry occasioned by whispering and walking on tiptoe; the prevalent error that the sufferer must have warmth even at the sacrifice of pure air; the alarm which is inconsiderately created in children's minds by 'ambiguous giving out' about the doctor—all which points should be set down in the tablets of those to whom they are new. The list of household remedies comprises well-known compounds, refreshing drinks, poultices, and baths, for the preparation of which the author gives clear directions. We note the following: offensive medicines may easily be administered by first deadening the child's taste with a piece of cheese or alum, or by placing a powder between layers of bread and milk, in a spoon; and castor-oil may even be made a delight, if beaten up with an egg, heated, and, when cold, served with sugar, currant-jelly, or lemon-juice; the edges of a poultice should always be suffered to stick closely to the skin; a stocking-leg loosely filled with dry bran, steamed over a fire, or dipped into boiling water, forms a good poultice for neck or throat; in bathing, very young children should not be subjected to the extremes of temperature; to prevent infection spreading through a house, sheets or blankets constantly moistened with disinfecting fluid should be suspended across doorways and passages leading to the sick-room; and lastly, fresh air is the only reliable purifier of a close room, fumigants and deodorants only hiding the evil they are meant to oust. The more dangerous diseases of childhood, such as scarlatina, measles, &c., are considered at length, and their several symptoms closely indicated in tables of comparison, where mistake is possible; the precautions to be taken in battling with the complaint, on which success depends more than on medication, and the duties to be observed during convalescence, being laid down with exactness. On the subject of infection—which has been lately noticed in this *Journal*—Dr Barker lifts up his voice against the wrong-doing of all persons who neglect to stay the spread of disorder. The premature removal of patients in public conveyances, second-hand

clothes, and furniture auctions, the out-patient department of hospitals, the distribution of alms by the charitable at their own doors, the servants' washing, which, when not sent to the family laundress, is dried and got up in a little stuffy room occupied day and night by a poor woman and her numerous brood; the garments sold at large tailoring establishments, and made by seamstresses, whom sharp misery renders an easy prey to disease—all such are some of the hot-beds from which sprout a goodly crop of ills to man.

The subjects of commoner ailments, emergencies and accidents, accompanied by plainly worded prescriptions and recipes, are treated with the carefulness and liberality of thought which characterise the entire book. For Dr Barker, be it understood, is nothing if not liberal, and whilst free from any particular crotchets, with pure air for his chief specific, he often seeks to impress upon us the truth, that there is a wisdom in natural treatment beyond the rules of physic, and that no 'royal roads' have yet been made leading to the cure of diseases. To mothers in every class, to the wives of emigrants and others abroad, and to the visitors of our poor at home, to all to whom children are a care and delight, we would commend this book.

#### WINTER'S HOPE.

THE Autumn days are gone—all flown;  
The yellowing leaves from off the trees  
Are shed, with sad and doleful moan  
Of whistling wind and mournful breeze.

The cumbered earth bears far and near  
Those saddening signs of Autumn's death;  
And leafless forests, moist and drear,  
Oppress us with their chilly breath.

But let us look around once more—  
Is there no beam to cheer our sight?  
No rift in these dark clouds? Ah! sure,  
We are not left without some light!

No; 'tis not so! E'en while we gaze,  
See, from yon hill the red sun rise,  
Illuming with his cheering rays  
The earth that all so darkly lies.

And in deserted hedgerow springs  
The hawthorn berry, brave and bright;  
While perched atop the robin sings  
His clear, sweet song with all his might.

Our life will come to autumn hours,  
And all may chill and dreary seem,  
But even then we'll find some flowers,  
And even then some joyous beam.

Bepine not, therefore, that thy youth  
And manhood's prime so swiftly flee;  
Lo! with advance of years come truth,  
New light, new hope, calm joys for thee.

## STORY OF LADY FORBES.

THE family of Forbes in its several leading branches is one of the oldest and most honourable in Aberdeenshire, for it was historically signalised as far back as the early part of the fifteenth century. One of its branches was raised to the peerage in the person of Sir Alexander de Forbes, in 1436, one of whose descendants is, at this day, the Premier Baron of Scotland. A brother of this Sir Alexander was ancestor of Alexander Forbes of Pitsligo, who was elevated to the peerage in 1633. As Lord Pitsligo, he had three successors in regular descent, the last of them being the unfortunate Alexander, fourth Lord Pitsligo, attainted for his accession to the Rebellion of 1745; his estates being at the same time escheated and sold by the crown. From the simplicity of his character, his scholarly tastes, and other circumstances, he has been fitly represented as a good prototype of the Baron of Bradwardine in *Waverley*. Another branch of the family was that of the Forbeses of Monymusk, raised to a baronetcy in 1628. They did not come to ruin in the same way as their cousins of Pitsligo; there was no rebellion in the case; but the ruin financially was not less complete. To appease creditors, Monymusk had to be sold. It was a sad affair to leave the old venerated home, but for it there was no help. When a landed gentleman is encumbered with debts and difficulties, the best thing he can do is to denude himself of his responsibilities, and start unembarrassed on a new and hopeful career. Sir William Forbes was quite alive to a step of this kind; but when the day came for bidding adieu to his paternal inheritance, he drove away from the old home with a pang of regret. The sacrifice was made.

It was not left for this impoverished gentleman to recoup the family fortunes. His son, who died before him, married a lady, a descendant of the third Lord Pitsligo, and those two had a son, William, who, without fortune, became an advocate at the Scottish Bar. In the family history we

do not hear much of the advocate. As a poor baronet, his title was perhaps an encumbrance. He, at any rate, made a fair effort at professional advancement, and in domestic concerns was helped by a good wife, Christian Forbes, daughter of Forbes of Roynallie, to whom he was married in 1730. Known in her time as Dame or Lady Christian Forbes, she performed a part which has been rarely equalled for dignity and self-reliance in circumstances somewhat trying for one in her social position.

Looking around in the present day, we on all hands see people with no special pretensions as to rank living in houses more superb, salubrious, and comfortable than those occupied by princes of the blood a hundred and fifty years ago. The progress made by wealth and taste within three or four generations is beyond the dreams of romance. When, in 1730, Lady Forbes arrived in Edinburgh as a newly married wife, the home to which she was introduced was such as would now be occupied by about the humblest family in the city. Edinburgh had not yet expanded north or south. There was no New Town. The population was crowded into a single ancient street, with dingy diverging closes or lanes. High and low, rich and poor, were accommodated in the same tall buildings, with no other distinction than that the poorer dwelt in the cellars and garrets, while the nobility and gentry had the run of the first and second floors. It was a curiously intermingled state of society, shockingly incongruous, but droll and amusing, and not without some good points; for proximity in residence led to general sympathy and a certain kindliness of intercourse, which cannot be said to prevail in these later times. Near the centre of the town there were lanes specially preferred as the residence of lawyers, as they could thence walk conveniently in their gowns and wigs to the courts in the Parliament House.

It was in one of these confined alleys that Lady Forbes took up house with her husband, and here she had several children, three of whom—a son and two daughters, died, leaving her, however, two sons to occupy her attention. In 1743 came a

greater calamity. That year, her husband, Sir William, died, and having no longer any reason to reside in Edinburgh, she removed to Aberdeen, in order to educate her two boys, with a frugality suitable to her means. In 1749, she lost the younger of the two; and now only one, the youthful Sir William Forbes, engaged her motherly care. At the excellent seminaries in Aberdeen, he received an education at an expense so small as to put to shame the extravagant outlay that would now be incurred in more modern establishments. At length, a time came when it was necessary for the youth to adopt a means of livelihood. The learned professions were thought of; but besides that the education for any of these was costly, they were at the best precarious. Years might be spent, with no satisfactory result. Lady Forbes took the wise resolution of putting her son to a commercial profession; and through the interest of a friend, Mr Farquharson, accountant, was fortunate in getting him appointed as an apprentice to Messrs Coutts, bankers in Edinburgh. To that city she accordingly proceeded with the youth in October 1753, when he was fifteen years of age.

In a narrative regarding his mother recently published, Sir William presents us with an account of the economy which she practised on returning to Edinburgh. It cannot fail to be read with the deepest interest. 'My mother,' he says, 'did not at first begin housekeeping by herself, but we lodged and boarded with a gentlewoman, the widow of Alexander Symmer, a respectable bookseller in the Parliament Square, with whose family my brother and mother had been well acquainted. And it is worth recording, as a proof of the difference of the expense of housekeeping at that time in Edinburgh, that the sum we paid for board and lodging was no more than at the rate of £20 a year for each of us. We drank no wine, indeed; but Mrs Symmer's table, though plainly, was plentifully supplied. At Whitsunday 1754, my apprenticeship commenced, when my mother took possession of a small house, which she hired and furnished in Forrester's Wynd.' A 'wynd,' we stop to say, is a lane somewhat wider than the ordinary closes, and considered to be more of a general thoroughfare. Forrester's Wynd, which formed a passage from the Lawnmarket to the Cowgate, is now obliterated, having been cleared away to make room for the buildings of the Advocates' Library. 'The house so rented in this dingy alley,' continues Sir William, 'consisted of a couple of rooms, a bed-chamber and kitchen, all on the same floor, as was the manner in which houses were occupied at that time in Edinburgh; the rent was only £7 a year, and our establishment comprised a single maid-servant, who sufficiently answered every purpose of our private mode of living.

'Yet in this humble manner my mother preserved a dignity and respectable independence, and properly supported the character of my father's widow. Dinners and suppers of ceremony she gave none, except one supper in the course of the year to the gentlemen to whom I was apprentice. But she was visited by persons of the first distinction, whom she received at tea in the afternoon. This was a mode of entertainment much practised at that time in Edinburgh, though now totally disused in the refinement and extravagance of modern luxury, and it was a custom productive of many advantages. Not only were persons of the highest

birth, though of slender income, enabled in this inexpensive manner to entertain those friends whom they could not afford to receive in any other manner, but the drawing-rooms of ladies of the most opulent families, where dinners and suppers were given, were generally frequented in the afternoon by the young and old of both sexes, and thus became a school where elegance of manner, and a taste for polite and sensible conversation, were acquired, which we look for in vain in the present state of society, where in general there is more of form than of real kindness, more of vanity and expensive show than of genuine hospitality. Those circles at that time in Edinburgh, the very remembrance of which is worn out, except among a few old people, were select, though not numerous, and very unlike indeed to the crowded routs and assemblies of the present day. We afterwards occupied various houses in other parts of the town, but always in the same humble and low-rented style, such as our slender income could afford, which at that time very little exceeded a hundred pounds a year.'

In this simple and very charming account of how a young baronet and his mother lived, when in depressed circumstances, about the middle of last century, we have a glimpse of the change of manners which had already taken place thirty years later. At the earlier period—say 1755 to 1765—dinner appears to have taken place in good society at from two to three o'clock; then, there was tea at five to six, being the meeting which Sir William so heartily eulogises; lastly, supper at eight o'clock. It is curious to note that under different designations the meals at the present day are but a repetition of what prevailed a hundred and twenty years ago. For dinner we have to substitute the word luncheon; for the afternoon tea we have the modern kettle-drum, or tea at five o'clock; and supper is represented by the seven or eight o'clock dinner. There must, one would think, be something inherent in natural wants and tastes, that, despite of fashion, brings society round to the usages prevalent in the days of our great-grandmothers. The only thing to be seriously regretted is, that the old-fashioned, cheerful supper, with its songs and genial intercourse, should be so poorly represented by the stiffly ceremonious and costly dinner of our own times.

Meanwhile, how was Sir William getting on as an apprentice to the Messrs Coutts, who carried on their banking concern on the third floor of a building in the Parliament Square? Previous to his being taken as an apprentice, old John Coutts, the father of the family, and who was for some time Lord Provost of Edinburgh, died (1750), and now the business was conducted chiefly by his sons. Of these, John, the second son, took the leading management, and it was to his counsels and example that the young baronet owed much of his success. John, however, died in 1761; his place being taken by his next younger brother, James, on whom devolved an additional burden, for Patrick, the eldest, and Thomas, the youngest son, had gone to conduct a branch of the business in London. These clearances, along with several changes in the copartnery, were not unfavourable to the advancement of young Forbes, who, from apprentice, rose to be a clerk and assistant manager. In 1763, his excellent abilities and

application to business induced the firm to admit him as a partner. In these various steps in his progress, we are to view Sir William as guided not less by principles of integrity and assiduity, than by a deep-seated wish to earn means for recovering the estates lost by family misfortune—Pitsligo or Monymusk, as might be most available. That, he constantly kept in view. It served as an honourable incitement, which overcame petty difficulties and privations, and silently spurred him on with a resolution which no obstacle could abate.

It was a great thing for him to feel that, small as was his share in the business of the firm, he was on the way to fortune. All he had to do was to continue to be frugal and industrious. In rising in the world, he could not of course adhere to the scrupulously economical routine with which he and his mother had begun housekeeping in Forrester's Wynd. In the narrative already referred to, he proceeds to mention how the modest ménage was expanded: 'We removed to a somewhat better house, and a little enlarged our household, by first keeping a foot-boy, and afterwards a man-servant. But we still continued to live in a very retired manner; for although we began occasionally to have a few friends with us at dinner or supper, I was careful not to oppress her with too much company, to which, for many years since the death of my father, she had not been accustomed, and the entertaining of whom was, by consequence, a greater fatigue than I was willing she should undergo. In this manner we lived during other seven years, until the period of my marriage.'

Sir William Forbes was married in 1770 to Elizabeth, eldest daughter of Dr (afterwards Sir James) Hay; a union productive of much happiness to his future life. This event obliged him to separate from his mother, the old and venerated guide of his infant years. She continued from that time to live alone; her residence being still in one of the obscurities of the Old Town. According to Peter Williamson's Street Directory for 1784, her ladyship occupied a dwelling in Gray's Close, and there, we infer, she remained till her decease. Her concluding years formed a period of unbroken tranquillity and retirement. Blessed with a serene and contented disposition, enjoying the kindness of her son, and gratified by the rising prosperity and high character which he had obtained; and fortunate in seeing the fortunes of her own and her husband's family rapidly reviving under his successful exertions, she lived happy and contented to an extreme old age, calmly awaiting the approach of death, to which she looked forward neither with desire nor apprehension. After a life of unblemished virtue, sincere piety, and ceaseless duty, she died on the 26th December 1789. It is impossible to imagine a long life brought to a happier or more enviable conclusion.

Lady Forbes's habits of exactness regarding daily expenditure were something remarkable. She ran no bills, but paid for everything with ready-money; and, says Sir William, 'it was very singular, that when she died, except her house-rent and servant's wages, the day of payment of which was not yet come, and the account of bread and beer for her family, which she was in the habit of paying regularly at the end of every month, not a single farthing was due to any tradesman whom she employed. She carried this degree of regularity so far, that wish-

ing to give half a guinea to a poor woman to whom she occasionally gave alms, as the last bounty she might have it in her power to bestow on her, she had it wrapped in a bit of paper, and pinned it to her bed-curtains, in order that it might be in readiness against the first time the poor woman might call, and where we found it after her death. It will scarcely be doubted that I was at pains to discover the woman, and gave her the money. We found, too, one of her shifts wrapped up by itself, with a person's name pinned on it, of which we were at a loss to discover the meaning, until her maid-servant informed us that a poor woman having requested that my mother would furnish a shift to wrap her body in after she should be dead, she had laid this one aside for that purpose, probably thinking that it would not be so safe in the woman's custody as her own. She had been all her life accustomed to keep a written and very minute account of her personal and family expenses. Her books and everything else in her possession were found in as exact order as if, previous to her last illness, and before her strength failed, she had actually known that her life was so near a close. A rare instance of that watchfulness which is the duty of all, but, unhappily, practised by so few.'

The brothers Coutts having died out or quitted the banking concern, and gone to London, the business in the Parliament Square at length was carried on by Sir William Forbes and his partner, Sir James Hunter Blair, with, ultimately, Sir John Hay. It was long a flourishing business, and is now merged in the Union Bank of Scotland. Eminently successful, and much esteemed for his worth, Sir William Forbes filled a number of honorary public offices in Edinburgh. Admired for his benevolence, accomplished in his manners, and tall and graceful in person, he was in his latter days one of the notabilities of his time. It is interesting to know that he realised the long-cherished object of his life. By several different purchases, he acquired the estate of Pitsligo, that had been forfeited in 1745; he forthwith proceeded to bring the lands into the best state of cultivation, and to effect a variety of other improvements. The health of this estimable person began to decline in 1791, and in 1802 Lady Forbes died, a circumstance which sensibly affected his spirits. Yet, he was able to devote a portion of his time to literature. He wrote the *Memoir of a Banking-house*, being that in which he had been long concerned, the object of the work being to impress on his eldest son and successor those correct principles of business management by which he had himself been guided. He likewise wrote the *Life of his friend Dr Beattie*, which met a favourable reception, not merely as an elegant narration of the biography of an eminent man, but as preserving a great amount of the general literary history of the country which must have otherwise perished. He did not long outlive this effort. After being some months confined to the house, he died in November 1806, surrounded by his friends, and inspired by every hope which a virtuous and useful life is capable of affording. Sir William Forbes had a large family of sons and daughters, from whom sprung numerous descendants connected with law, science, and literature.

Had Sir William Forbes lived in our own day, he would probably have been a contributor to

various periodicals, for, from the quantity of miscellaneous papers which he wrote and left to his family, he appears to have devoted much of his time to literary composition. The more notable of these papers, a *Narrative of the Last Sickness and Death of Dame Christian Forbes* has just been published after an interval of nearly ninety years. It is from this interesting posthumous work we have been able to draw some of the particulars of the foregoing sketch. Appropriately, the volume has been edited by a grandson of Sir William, namely, Alexander P. Forbes, bishop of Brechin, one of the most erudite men in Scotland, and combining in a remarkable degree the estimable qualities of his family, but on whom, amidst universal regret, the tomb has prematurely and very lately closed. As a view of past manners, of which we have presented a feeble outline, the book forms an acceptable contribution to literature. W. C.

### A LADY'S NOTES ABOUT CHINA AND JAPAN.

EVER since the assassination of the unfortunate Mr Margary, on the 21st of last February, in the mountainous wilds at the extreme south-west of the Chinese Empire, an unusual amount of public attention has been attracted to China and the Far East generally, and this will doubtless lend a greater interest to a lady's impressions of China and Japan than the book \* itself in which they are recorded would otherwise deserve for its intrinsic merits. Without attempting a critical review of the work, we propose briefly to allude to some of the salient points in the letters which deal with the manners and customs of the two peoples.

At the outset, the writer experienced, as others have often done, a great difficulty in distinguishing one Chinaman from another. She found them a very noisy race; so much so, that when labourers passed her house, which they did in large numbers all day long, she 'rushed to the window to see what terrible catastrophe had happened.' Before very long, however, she discovered that 'all these tumultuous sounds mean nothing to excite alarm. Though they quarrel and use any amount of strong language, the combat is entirely oral, and never comes to blows, but ends, generally speaking, in the antagonists running off in different directions, turning round and shrieking to each other as they go, their farewell words of abuse.' Like all foreigners, L. D. S. had no opportunity of seeing much of Chinese women, excepting those in the lower ranks of society. She is decidedly of opinion that they are not pretty; but, she adds, 'their redeeming feature is their hair, which, as well as their eyes, is invariably black, and almost as invariably neatly dressed. How the dressing is accomplished in such hard, smooth rolls, and twisted up behind into such a curious form, resembling the handle of a tea-pot, I cannot tell. A long ornamental pin is stuck through it, which protrudes a good many inches on each side of the hair; and a bright flower, either real or artificial, worn at one side, gives them, in spite of their plain looks, rather a picturesque appearance.' A noticeable peculiarity about Chinese boys is, that they have few games of their own; the only one the

writer observed them playing, was with a kind of shuttlecock, which they tossed from one to the other, hitting it in a marvellous way with their feet; so that great activity and suppleness are necessary for the performance.

One of the first difficulties that the European resident in or near a Chinese city has to overcome, is that of sleeping through the din which everywhere makes the night hideous. Our writer describes this very correctly; and, from a bitter personal experience, we can sympathise with her in her early struggles over her night's rest. First come, she says, one set of watchmen rattling bamboos vigorously, and thereby giving due notice to any who may be out on a thieving raid, that they had better hide themselves. Then there follows at stated periods a greater magnate of the same species, who goes his rounds to see that his minor brethren are awake, they being very apt to rattle their bamboos in their sleep, and he makes a still more excruciating noise by banging a gong as loudly as he can. Certainly light sleepers ought not to brave a residence in the Celestial Empire, unless it be in one of the more orderly foreign settlements, where these and similar annoyances are reduced to a minimum.

Bank holidays and Sundays not being noted in the Chinese calendar, the natives naturally set great store by their festivals, of two of which—the Festival of Dragon Boats, and the Feast of Lanterns—L. D. S. furnishes some account. In describing the former, which usually occurs early in June, she says: 'These boats are very long and narrow, and are gaily painted to imitate the national idea of a dragon, the high bow being made to represent the open mouth of the animal. They hold from twenty to thirty people, most of them armed with stout, short paddles, others with drums and gongs, on which they keep up an incessant noise while they race up and down the river.' The origin of this feast is said to be the death, some thousand years ago, of a Chinese patriot, who, having proposed some salutary measures for the good of the public, his prince not only declined to follow his advice, but banished him from court; which he took so much to heart, that he went and drowned himself. As he was very popular, his countrymen assembled and sought for his body, which they are supposed still to do at each anniversary of his death. The festival is also accompanied by various other superstitious observances, such as burning of sacred paper, placing food before the ancestral tablets, &c. Of the world-famous Feast of Lanterns, as it is celebrated in most Chinese towns, no one can find very much to say, and our writer's description of it comprises nearly all that can be said on the subject. 'For the last few evenings,' she observes, 'a number of people have been going about in processions, carrying lanterns and beating gongs—the former made in the shape of fish, cocks, and hens, and some very large ones illuminated by numerous lights, representing dragons. This amusement is called *manœuvring the dragon*, which is carried on poles by many bearers, so that the animal wriggles about like a great sea-serpent. This being the 15th day of the Chinese "No. 1 moon" [commonly about the end of February], is the day set apart for the special Feast of Lanterns; the noise of crackers, guns, &c. has therefore come to a climax, and the *manœuvring the dragon* is more energetic than ever.'

\* *Letters from China and Japan.* By L. D. S. London: Henry S. King & Co. 1875.

As many absurd notions are current in this country about the uncleanly feeding of the Chinese, we condense the following account of a dinner given by an official, at which L. D. S.'s husband was present, in proof that the Celestials are not so bad in this respect as they are sometimes thought to be. The small tables were furnished with saucers, little bowls, a china-ware spoon, and a pair of chopsticks for each person. The dinner was composed of *everything* except beef and mutton, which are seldom eaten by natives in the part of China referred to; the staple materials for their dishes are pork, fowl, and fish, all kinds of vegetables, sea-weed, fungi, &c. Everything, be it noted, is boiled, and comes to table in the form of soup, stew, or haricot. The table is served by each person having put before him a 'portion' of whatever the 'course' may be; but there is often a large dish placed in the centre, and also dishes of condiments into which all dip their chopsticks! It is impossible to attempt a description of the numberless dishes composing the feast, but the writer mentions one 'to which justice was always done. It is made from what in England are only used to pelt unpopular candidates at elections. What process they undergo before coming to table is unknown, but they appear like hard-boiled, black eggs, stewed in some very palatable sauce, and are really excellent.' A dinner of the kind alluded to often extends to thirty or forty courses, and lasts three or four hours. Rice-wine, *hot* and very tasteless, is constantly handed round in tiny cups, and the Chinese drink a good deal of it, though they very rarely become intoxicated; they merely get excited in manner and flushed in the face. Oddly enough, the crowning dish of the repast is a huge bowl of plain, boiled rice; it is said that this prevents any evil effects from excess either of eating or drinking--sobers you, in fact, and sends you away from table with a clear intellect.

As she wrote her letters professedly for the entertainment of her relatives at home, L. D. S. does not attempt to give a detailed account of the peculiarities of social life among the Chinese; and besides the points to which we have drawn attention, the most important information she gives relates to some of the ceremonies attendant upon the death of the father of a prominent Chinese official, who has since attained to a very exalted position. The subject is of too melancholy a nature to follow it out in all its details; but we hope we shall be pardoned for alluding particularly to one phase in the proceedings, which we venture to think will appear curious and worthy of special notice. On the death of a parent, it is customary in China, at any rate with persons above a certain rank in the social scale, to forward to all friends and acquaintances, however slight, a formal notification of the fact, written in mourning-ink, and on mourning-paper of portentous dimensions. On the present occasion, this document (in which, be it observed, the family name of the parties, *Shên*, is omitted), ran as follows: 'Be it known that the unfilial Pao-chên, who, on account of his manifold and grievous crimes, was worthy of sudden death, has not died, and that, instead, the calamity has fallen upon his worthy father; upon whom the reigning Emperor of the Ta-Ching [*lit.* great pure] dynasty has conferred the first order of rank in the Civil Service, and that in the Imperial

Body Guard, and the governorship of the province of Kiangse.

'In the twelfth year of the reign, styled Tao-Kuang, at the competition of the literati, he gained the rank of Chii-jên [that is, M.A.].

'The writer's father, Tan-lin, fell sick on the ninth day of this moon, and lingered in great pain until the twelfth, when he passed away. He was born about two or three in the morning of the ninth moon, of the fifty-second year of the reign, styled Chien-Lung, and was therefore somewhat over eighty-four years old. Immediately he expired, the family went into mourning, and now, alas! have sorrowfully to communicate with you.

'We have chosen the 18th, 19th, and 20th for the return presentation of this card [that is, will then receive visits of condolence]. No funeral presents can be received. The writer and his brother are kneeling with forehead in the dust, weeping tears of blood. The sons of the writer and of his brother, nine in number, are kneeling with downcast faces, weeping tears of blood. The relatives and descendants, to the number of nine, are on their knees (before the coffin), beating their heads upon the ground.

'[From] the residence of the writer, named the Ancient Grotto of the Fairies.'

The inexorable limits of space prevent our dealing more minutely with the Letters from China; and we must now follow our author in her brief visit to the Land of the Rising Sun, which of late years has attracted much notice by the rapid manner in which it has endeavoured to adapt itself to the ways of western civilisation. In one of the first Japanese towns she visited, L. D. S. was much struck at the better appearance of the streets, as compared with those of Chinese cities, which, except in very rare instances, are all narrow and dirty. There is also, she says, a marked and most pleasing contrast in the cleanliness of their houses; and so fearful are they of the floor being dirtied, that they always take off their shoes before going indoors. Such care is very necessary, for they have neither bed, chairs, nor tables; and consequently the floor, which is generally covered with nice clean matting, has to serve the purpose of all these articles of furniture. Our author came to the conclusion, from all she saw and heard, that the Japanese are 'even a more intensely conceited nation than the Chinese, and after attaining the most superficial knowledge of any subject, are quite satisfied that they know as much as those who are teaching them.' They seemed, however, to her 'to be a polite nation, and this even among the lower classes, who bow to each other in the most ceremonious and respectful manner. When one man approaches another, the two stop when some yards apart, make a sudden, jerky, very low bow, say a word or two, and then pass on with the same diving style of salutation.' Of the dress of the Japanese it would be superfluous to say much, for at present it is in a transition state, combining a curious mixture of the European and native styles, the effect of which is at times singularly ludicrous.

As we have mentioned above, L. D. S.'s visit to Japan was a brief one, and her letters from that country are consequently of a somewhat desultory nature, and do not convey much information respecting the social life of the Japanese. This,

however, was almost inevitable from the unsettled state of the domestic institutions of the land, respecting which a casual visitor like herself could not hope to obtain much definite knowledge. She moved about a good deal, however, during her short stay, and saw as much as was possible of the Treaty ports, and the country in their neighbourhood. During her expedition to Yedo, she paid a visit to the famous temple of Asakusa, which had the name of being the most handsome in the country, and which she describes as 'gorgeously decorated with gold lacquer.' In the extensive garden and grounds which surround this temple she saw 'most curious specimens of the national skill in training plants (some of them not more than from one to two feet high) to assume the appearance of ancient trees. There were also some most grotesque wooden figures clothed in garments of chrysanthemum, and placed in all sorts of ridiculous attitudes. One, for instance, represented a boy tumbling head over heels, the different parts of his dress being formed by the foliage, and flowers of different colours; the trousers brown or green, the coat yellow, and the waistcoat white. A steam-engine and railway carriage nearly as large as real ones were perfectly modelled in the same way. The body of the carriage was green; yellow flowers formed the foot-board; the wheels were brown, and the windows some other colour.' How these plants could be trained in such a marvellous manner, baffled our author's comprehension; but she formed the very natural opinion, in which our readers will agree, that 'the artists must not only possess skillful hands, but infinite patience, as well as most grotesque imaginations.'

## THE FLAG OF DISTRESS.

### CHAPTER XLVIII.—LONG SUFFERING.

SEVERAL days have elapsed since the desertion of her crew, and the *Condor* is still afloat, sailing in a south-westerly direction, with full canvas set, just as when the pirates put away from her. Why she has not gone to the bottom is known but to two men—they intrusted with the scuttling. And just as when left are the three unfortunate beings aboard: the black cook on his galley bench, the captain and his passenger *vis-à-vis* bound at the cabin table, upright in their chairs. But though their attitudes are unchanged, there is a marked change in their appearance, especially those who occupy the cabin. For the white man shews the effects of physical suffering sooner than the Ethiopian. For long days they have been enduring agony great as ever tortured Tantalus. It has made fearful inroad on their strength, on their frames. Both are reduced almost to skeletons; cheek-bones protruding, eyes sunken in their sockets. Were the cords that confine them suddenly taken off, they would sink helpless to the floor!

Not all this time have they been silent. At intervals they have conversed upon their desperate situation. For the first day, with some lingering hope of being released; but afterwards despairingly, as the hours pass, and nothing occurs to alter it.

Now and then they have heard cries on deck; knowing they are from the cook, whom they now feel sure is like themselves fast bound in the forward part of the vessel. At first they answered them, till finding it an idle effort; and now their feeble strength forbids even the exertion of their voices.

Long since have the two men given up making attempts to untie themselves—now they have also ceased to converse, or only at periods long apart. Lantanas, after his first throes of fierce rage, has sunk into a sort of stupor, and, with head drooping down to his breast, appears as if life had left him. Don Gregorio, on the contrary, holds his erect—at least during most part of the day. For, before him is something to be seen—the sea through the stern windows, still open. He keeps his eyes bent on it habitually; though not with much hope of there seeing ought to cheer him. On its blue expanse he beholds but a streak of white, the frothing water in the vessel's wake, now and then a 'school' of tumbling porpoises, or the 'spout' of a cachalot whale. Once, however, an object comes within his field of vision, which causes him to start, writhe in his ropes, and cry out to the utmost of his strength. For it is a ship in full sail, crossing the *Condor's* track, and scarce a cable's length astern! He hears a hail, and calls out in response, Lantanas joining him. And the two keep shouting for hours after, till their feeble voices fail them; and they again resign themselves to a despondency, hopeless as ever. All their shouts have brought them are the Bornean apes, that are heard scampering up and down the cabin-stair, dashing their uncouth bodies against the closed door.

The Chilian has long ago surrendered to despair; while Don Gregorio, who has also lost hope of help from man, still has faith in Heaven. With unabated fervour, he entreats for mercy from above, and as he does so, the Chilian captain gives way to a paroxysm of frenzy, raving as he bewails his unhappy fate. For long, he continues to rave. Don Gregorio makes no effort to hold converse with him. The sight is sufficiently painful, suggestive of what may be his own fate; as sweeps through his soul the thought of his accumulated calamities. He wishes that death would relieve him, and has prayed for it more than once. He prays for it again, silently, with his eyes resting on the sea. He awaits the final hour, longing for it to come, his features set in calm, Christian resignation.

Suddenly their expression changes, a ray of renewed hope shooting athwart his face. Not a ray, but a beam, which spreads over his whole countenance, while his eyes kindle into cheerfulness, and his lips seem parted in a smile! Is he about to echo the mad laugh of Lantanas?

No! In that look there is no sign of unseated reason. On the contrary, he gazes with intelligent earnestness, as at something outside demanding investigation. Soon his lips part further, not to smile, but speak words that involuntarily issue from them. Only two little words, but of large import and greatest cheer: 'A sail!'

For such he has espied. A white speck, away off on the line that separates the two blues, but distinguishable from wail of floating foam, or wing of gull. Beyond doubt, a sail—a ship! Once more, hope is in his heart, which, bounding up, beats audibly within his breast. Higher and louder,

as the white speck shews larger, assuming shape. For the tall narrow disc, rising tower-like against the sky, can only be the spread canvas of a ship. And gradually growing taller, he at length can tell she is standing towards the barque! Intently he continues to watch the distant sail. Silently, without saying aught of it to his companion, or in any way communicating with him. It would be useless now; the mind of the Chilian is closed against outward things, and it is not the time to open it.

Hopefully, Don Gregorio keeps gazing, yet not without anxiety. Once before has he had disappointment from a similar sight. It may be so again. But, no; that ship was standing across the *Condor's* track, while this is sailing in the same course—sailing after, apparently, with the intention to come up; and though slowly, surely drawing nearer, as he can tell by the canvas increasing in bulk, growing broader and looming higher.

A long time, however, elapses—nearly half-a-day—during which he has many hopes and fears, alternating as the hours pass. But the former are at length in the ascendant, and all anxiety passes as the pursuing ship shews her dark hull above the water-line, and he can distinguish her separate sails. They are all set. What joy in his heart as his eyes rest on them! They seem the wings of merciful angels, coming to relieve him from his misery. And that flag floating above—the flag of England! Were it the banner of his own Spain, he could not regard it with greater gladness or gratitude. For surely he will be saved now! Alas! while thus congratulating himself, he sees that which causes his heart again to sink within him, bringing back keenest apprehensions. The strange vessel is still a far way behind, and the breeze impelling her, light all along, has suddenly died down—not a ripple shewing on the sea's surface—while her sails now hang loose and limp. Beyond doubt is she becalmed!

But the *Condor*? Will she, too, cease sailing? Yes; she must, from the same cause. Already she moves slowly, scarce making way. And now—now she is motionless! The glass rack and lamps overhead hang steady, without the slightest oscillation. But the barque gradually swings round, and he loses sight of the ship. Through the windows he still beholds the sea, calm and blue, but vacant; no outline of hull—no expanded sails—no flouting flag to keep up his heart, which, for a while, is down, almost despondent. But only for a short time; again rising, as the barque, sheering round, brings once more stern towards the ship, and he sees the latter, and something besides—a boat! It is down in the water, and coming on toward the *Condor*, the oar-blades flashing in the sun, and flinging spray-drops that seem like silver stars! The barque eddying on, he has the boat in view but a short while. What matters it now? He is no more apprehensive, but certain of being saved. And he looks no longer—only listens. Soon to hear words spoken in a strong manly voice, to him sweeter than music. It is the hail: 'Barque ahoy!'

In feeble accents he makes answer, continuing to call out till other voices, echoing along the *Condor's* decks, become commingled with his own. Then there are footsteps on the quarter-deck, and they are soon after heard descending the cabin-stair. The handle is turned; the door pushed open; and

a swish of fresh air sweeps in, human beings along with it; as they enter, giving utterance to exclamations of astonishment.

Wrenching his neck around, he sees there are two of them, both in the uniform of naval officers, and both known to him! Their presence gives him many emotions—too many for his strength, so long and sorely tried. Overpowered by it, he becomes unconscious, as though the sight, instead of gladdening, had suddenly deprived him of life!

No need to say, that the officers who have entered the *Condor's* cabin are Crozier and Cadwallader. For she is the polacca barque we have seen chased by a frigate—that frigate the *Crusader*.

#### CHAPTER XLIX.—A CARD UNEXPECTEDLY RECOVERED.

It is the fourth day since the English officers—lieutenant, midshipman, and coxswain—boarded the Chilian barque. They are still on board of her, and she yet afloat—the one a sequence of the other. Otherwise, she would now be at the bottom of the sea. For the squall that struck, would have thrown her on her beam-ends, but that her sheets and halyards were cast loose at an opportune moment, so saving her from certain destruction. Her sails have suffered, nevertheless; scarce one that was not torn to shreds, excepting a storm-stay and trysail, which they were enabled to set during the gale. And now that it is over, they have managed to bend on a new foresail and jib, found among the barque's spare canvas. With these she is making way at the rate of some six knots an hour, her head set east-by-south. A grim terrible fight that squall gave them; only the three men to manage so large a craft in a tempest which, though short-lived, was fierce as ever swept over the Pacific. They had no aid from any of the other three, nor from two of them have they any yet. Captain Lantanas is still delirious, locked up in his state-room, lest in his madness he may do some violent act; while Don Gregorio, weak as a child, reclines on the cabin settee, unable to ascend to the deck. The negro alone, having partially recovered strength, lends some assistance at the sails.

It is twelve o'clock meridian, and Grummet, the coxswain, is at the wheel; the officers on the quarter; Crozier, sextant in hand, 'shooting the sun.' They have long ago given up hope of finding the frigate, or being found by her.

The signal-gun, heard by them repeatedly throughout that wild night, they could not answer; neither in the fog know its direction. At the time, it sounded like their death-knell; and now any chance of their coming across the *Crusader* is as one in a thousand. Aware of this, they are steering the crippled vessel towards Panama in hope of there finding the frigate. In any case, that is the port where they will be most likely to get tidings of her.

A prey to saddened thoughts are the two young officers, as they stand on the quarter-deck of the Chilian vessel taking the altitude of the sun, with instruments her own skipper is no longer able to use. Fortunately, these things had not been carried off, else there would be but little likelihood of their making Panama. At best, they will reach it with broken hearts; for they

have heard the whole story in all its dark details, so far as Don Gregorio could give them.

Having already determined their longitude by the barque's chronometer, they have kept it by log-reckoning, and their present observation is but to confirm them in the latitude.

'Starboard your helm!' shouts Crozier to Grummet. 'Give her another point to port. Keep her east-by-south. Steady!'

Then turning to Cadwallader, he says: 'If all goes well, we shall make Panama in less than four days. We might do it in two, if we could but set sail enough. Anyhow, I think old Bracebridge will wait for us at least a week. Ah! I wish that were all we had to trouble us. To think they're gone—lost to us—for ever!'

'Don't say that, Ned. There's still a hope we may find them.'

'And found, what then? You needn't answer, Will; I don't wish to speak of it: I daren't trust myself to think of it. Carmen Montijo—my betrothed—captive to a crew of pirates!'

Cadwallader is silent. He suffers the same agony, thinking of Inez.

For a time the picture remains before their minds, dark as their gloomiest fears and fancies can paint it. Then across it shoots a ray of hope, sinister, but sweet; for it is a thought of vengeance. Cadwallader first gives expression to it.

'Whatever has happened to the girls, we shall go after them anyhow. And the robbers, we must find them.'

'Find and punish them,' cries Crozier. 'That we surely shall. If it cost all my money, all the work of my life, I'll revenge the wrongs of Carmen Montijo.'

'And I those of Inez Alvarez.'

For a while they stand silently brooding upon that which has brought such black shadow over their hearts. Then Cadwallader says:

'They must have plotted it all before leaving San Francisco; and shipped aboard the Chilean vessel for the express purpose of getting this gold. That's Don Gregorio's idea of it, borne out by what he heard from that ruffian he knew there—Rocas the name, he says.'

'It seems probable—indeed certain,' rejoins Crozier. 'Though it don't much matter how, or when, they planned the wicked deed. Enough that they've done it. But to think of Harry Blew turning traitor, and taking part with them! That is to me the strangest thing of all, and painful as strange.'

'But do you believe he has done so?'

'How can I help believing it? What Don Gregorio heard leaves no alternative. He went off in the boat along with the rest; besides saying words which prove he went willingly. Only to think of such black ingratitude. Cadwallader, I'd as soon have thought of suspecting yourself!'

'His conduct, certainly, seems incredible. I believed Blew to be a thoroughly honest fellow. No doubt the gold corrupted him; as it has many a better man. But let's think no more about it; only hope we may some day lay hands on him.'

'Ah! If I ever do that! With my arms around him, I once saved his worthless life. Let me but get him into my embrace again, and he'll have a hug that'll squeeze the last breath out of his body!'

'The chance may come yet, and with the whole

scoundrelly crew. What brutes they must have been! According to Don Gregorio's account, they were of all nations, and the worst sort of each. The negro says the same. Among them four that spoke Spanish, and appeared to be Spaniards, or Spanish-Americans.' Suppose we pay a visit to the fore-castle, and see if we can find any record of their names. It might be of use hereafter.'

'By all means!' assents the lieutenant; and the two start for the fore-deck in silence, with anxiety upon their faces. For there is a thought in their hearts, which neither has yet made known to the other—black, and more bitter, than the knowledge of Harry Blew's treason. Unspoken, they carry it into the fore-castle; but they are not many minutes there, before seeing what brings it out, without either having spoken a word. A bunk—the most conspicuous of the two tiers—is explored first. Among its scattered contents are papers of various sorts: some letters, several numbers of an old newspaper, and a pack of Spanish cards. Beside these is one of a different kind—a little bit of white card, with a name printed upon it. A visiting-card—but whose? As Crozier picks it up, and reads the name, his blood curdles, the hair crisping on his head: 'MR EDWARD CROZIER; U.S.M. FRIGATE CRUSADER.'

He does not need to be told how his card came there. Intuitively he understands, remembering when, where, and to whom he gave it—to De Lara on the day of their encounter in front of Don Gregorio's house. Thrusting it into his pocket, he clutches at the letters, and looks at their superscription—'Don Francisco de Lara.' Opening them, he rapidly reads one after the other. His hands holding them shake as with a palsy; while in his eyes there is an expression of a painful nature; for he fears that, subscribed to some, he will find a name dear to him—that of Carmen Montijo. If so, farewell to all faith in human kind. Harry Blew's ingratitude has destroyed his belief in man. A letter from the daughter of Don Gregorio Montijo to the gambler Frank Lara, will alike wither his confidence in woman.

With eager eyes and lips compressed, he continues the perusal of the letters. They are from many correspondents, and relate to various matters, most about money and *monté*, signed 'Faustino Calderon.' As the last passes through his fingers, he breathes freely; though with a shrug of self-reproach, for having doubted the woman who was to have been his wife. Turning to Cadwallader—as himself, aware of all—he says in solemn emphasis:

'Now we know!'

#### CHAPTER L.—THE LAST LEAF IN THE LOG.

No common pirates then, no mere crew of mutinous sailors, have carried off Carmen Montijo and Inez Alvarez. It has been done by De Lara and Calderon. For although there is no evidence of the latter having been aboard the barque, it is deducible, and not even doubtful. With a design such as that before them, the confederates were not likely to have parted.

Several hours have elapsed since the discovery, and the young officers, again upon the quarter-deck, stand gazing in one another's faces; on both an expression of anguish, which the new knowledge has intensified. It was painful to think of their sweethearts being the sport of rough robbers;

but to picture them in the power of Francisco de Lara and Faustino Calderon—knowing what they do of these men—is agony itself.

'Yes; it's all clear,' says Crozier. 'No idea of getting gold has brought the thing about. That may have influenced the others who assisted them; but with them the motive was different, as fiendish. I see it now.'

'Do you know, Ned, I half suspected it from the first. You remember what I said as we were leaving San Francisco. After what happened between us and the gamblers, I had my fears about our girls being left in the same place with them. Still, who'd have thought of their following them aboard ship? Above all, with Blew there, and after his promise to protect them! You remember him saying he'd lay down his life for theirs?'

'Certainly, I do. If ever I find him, I shall make him suffer for that broken promise.'

'What do you propose doing after we reach Panama? If we find the frigate there, we'll be obliged to join her.'

'Obliged! there's no obligation to bind a man reckless as I—as this misery makes me. Unless Captain Bracebridge consent to assist us in the search, I'll go alone.'

'Not alone. There's one will be with you.'

'I know it, Will. Of course, I count upon you. What I mean is, if Bracebridge won't help us with the frigate, I'll throw up my commission, charter a vessel myself, engage a crew, and search every inch of the American coast, till I find where they've put in.'

'What a pity we can't tell the place! They must have been near land to take to an open boat.'

'In sight of—close to it. I've been questioning Don Gregorio. He knows that much, and but little besides. The poor gentleman is almost as crazed as the skipper. A wonder he's not more. He says they had sighted land that very morning, the first since leaving California. The captain told them they would be in Panama about two days after. As the boat was being rowed away, Don Gregorio saw it through the cabin windows. They appeared to make for some land not far off, lit up by a clear moonlight. That's all I can get out of him.'

'The old negro? Can he tell no better story?'

'I've questioned him too. He's equally sure of their having been close in to the coast. What point, he has no idea any more than the oranges. However, he states a particular fact, which is more satisfactory. A short while before they seized hold of him, he was looking over the side, and saw a strangely shaped hill—a mountain. He describes it as having two tops. The moon was between them, the reason for his taking notice of it. That double-headed hill may yet stand us in stead.'

'How unfortunate the skipper losing his senses! If he'd kept them, he could have told us where he was at the time the barque was abandoned. His getting lunny is enough to make one think the very Fates are against us. By the way, we've never thought of looking at the log-book. That ought to throw some light on the locality.'

'It ought; and doubtless would, if we only had it. You're mistaken in saying we never thought of it. I have, and been searching for it all along. But it's gone; and what's become of it I know

not. They may have thrown it overboard before leaving—though what good that would do them I can't see. The cook says it used to lie on a little shelf at the turning of the cabin-stair. I've looked there and everywhere else, but no log-book. As you say, it's enough to make one believe the Fates were against us. If so, we may never reach Panama, much less live to'—

'See!' cries Cadwallader, interrupting the despairing speech. 'Those brutes! what's that they're knocking about? By Jove! I believe it's the very thing we're speaking of!'

The 'brutes' are the Myas monkeys, that, away in the ship's waist, are tossing something between them; apparently a large book bound in rough red leather. They have mutilated the binding, and, with teeth and claws, are tearing out the leaves, as they strive to take it from one another.

'It is—it must be the log-book!' responds Crozier, as both officers rush off to rescue it from the clutch of the oranges.

They succeed; but not without difficulty, and a free handling of handspikes—almost braining the apes before these consent to relinquish it.

It is at length recovered, though in a ruinous condition; fortunately, however, with the written leaves unturned. Upon the last of these is an entry, evidently the latest made: 'Lat. 7° 20' N.; Long. 82° 12' W. Light breeze.'

'Good!' exclaims Crozier, rushing back to the quarter-deck, and bending over the chart. 'With this, and the double-headed hill, we may get upon the track of the despoilers. Just when we were despairing! Will, old boy; there's something in this. I have a presentiment that things are taking a turn, and the Fates will yet be for us.'

'God grant they may!'

'Ah!' sighs Crozier; 'if we had but ten men aboard this barque—or even six—I'd never think of going on to Panama, but steer straight for the island of Coiba. As the chart shews, that's the land they must have seen—or else Hicaron, which lies on its sou'-west side. With a light breeze, they couldn't have made much way, after the date of that entry. Oh! for ten good hands. A thousand pounds apiece for ten trusty lads! I only wish, in that squall, the cutter's crew had been left along with us.'

'Never fear, Ned. We'll get them again, or as good. Old Bracebridge won't fail us, I'm sure. He's a dear good soul, and when he hears the tale we've to tell, it'll be all right. If he can't himself come along with the frigate, he'll allow us men to man this barque; enough to make short work with her late crew, if we can once stand face to face with them. I only wish we were in Panama.'

'I'd rather we were off Coiba; or on shore wherever the ruffians have landed.'

'Not as we now are—three against twelve!'

'I don't care for that. I'd give ten thousand pounds to be in their midst—even alone.'

'Ned, you'll never be there alone; wherever you go, I go with you. We have a common cause, and shall stand or fall together.'

'That we shall. God bless you, Will Cadwallader! I feel you're worthy of the friendship—the trust I've placed in you. And now, let's talk no more about it; but bend on all the sail we can, and get to Panama. After that, we'll steer for the island of Coiba. We're so far fortunate in having

this westerly wind,' he continues, in more cheerful tones. 'If it keep in the same quarter for another twenty-four hours, we ought to sight land. And if this Chilian chart may be depended on, that should be the promontory on the west side of Panama Bay. I hope the chart is a true one; for Punta Malo, as its name imports, isn't a nice place to make mistakes about. If we should run too close to it, with this west wind'—

'Steamer to norward!' cries a rough voice, interrupting him. It is Grummet's.

The young officers, turning with a start, see the same. Crozier, laying hold of a telescope, raises it to his eye, while he holds it there saying: 'You're right, coxswain: it is a steamer; and standing this way. She'll run across our bows. Up helm, and set the barque's head on for her! I want to hail that vessel!'

Grummet obeys; and with a few turns of the wheel brings the *Condor's* head round, till she is right to meet the steamer. The officers, with the negro assisting, loose tacks and sheets, trimming her sails for the changed course.

Soon the two vessels, steered from almost opposite directions, lessen the distance between. And as they mutually make approach, each speculates on the character of the other. They on board the barque have little difficulty in determining that of the steamer. At a glance they see she is not a war-ship; but a passenger packet. And as there are no others in that part of the Pacific, she can be only one of the 'liners' lately established between San Francisco and Panama; coming down from the former port, her destination the latter.

Not so easy for those aboard the steam-ship to make out the character of the craft that has turned up in their track, and is sailing straight towards them. They see a barque, polacca-masted, with some sails set, and others hanging in shreds from her yards. This of itself would be enough to excite curiosity. But there is something besides: a flag reversed flying at her mainmast-head—the flag of Chili! It matters not what its nationality. Enough that they know it to be a signal of distress.

Responding to the appeal, the commander of the steam-packet orders her engines to slow, and then to cease action; till the huge leviathan, late running at the rate of twelve knots an hour, gradually lessens speed, and at length lies motionless upon the water.

Simultaneously the barque is 'hove to,' her sails cease propelling her; and she lies at less than a cable's length from the steamer. From the latter the hail is heard first: 'Barque ahoy! What barque is that?'

'The *Condor*—Valparaiso. In distress.'

'Send a boat aboard!'

'Not strength to man it.'

'Wait, then! We'll board you.'

In less than five minutes' time, one of the quarter-boats of the liner is lowered down, and a crew leaps into it. Pushing off from her side, it soon touches that of the vessel in distress. But not for its crew to board her. Crozier has already traced out his course of action. Slipping down into the steamer's boat, he makes request to be rowed to the ship; which is done without questioning. The uniform he wears entitles him to respect.

Stepping aboard the steam-ship, he sees that she is what he has taken her for: a line-packet from San Francisco, bound for Panama. She is

crowded with passengers, at least a thousand shewing upon her decks. They are of all qualities and kinds; all colours and nationalities; most of them Californian gold-diggers returning to their homes; some successful and cheerful; others downcast and disappointed.

He is not long in telling his tale; first to the commander of the steamer and his officers; then to the passengers. For to these he makes appeal—a call for volunteers—not alone to assist in navigating the barque, but to proceed with him in pursuit of the crew that cast her away.

He makes known his position, with his power to compensate them for the service sought; both endorsed by the commander of the steam-ship, who, in his anxiety to assist, is ready to answer for his credentials. They are not needed, nor yet the promise of a money reward. Among those stalwart men are many who are heroes—true Paladins, despite their somewhat threadbare habiliments. And amidst their soiled rags shine pistols and knives, ready to be drawn for the right.

After hearing the young officer's tale, without listening further, twenty of them spring forward in response to his appeal. Not for the reward he offers, but in the cause of humanity and justice. He could enlist twice or thrice the number, but deeming twenty enough, with these he returns to the *Condor*.

Then the two vessels part company, the steamer continuing on for Panama; while the barque, now better manned, and with more sail set, is steered for the point where the line of lat. 7° 20' N. intersects that of long. 82° 12' W.

#### HINTS FOR NILE-BOAT INVALIDS.

THE climates of Egypt and Nubia have gained well-deserved reputations of late years as winter residences, more especially for persons in delicate states of health, and requiring a milder climate than that of our islands. The tourist bent on sight-seeing, and in noways very particular as to personal comfort, requires few hints; but the invalid must needs be careful, and should guard against whatever is likely to interfere with his convalescence in a country where he will find few persons capable of advising him. Such individuals not unfrequently ask their doctor before starting: 'What are we to do when we get to Egypt?' and really, unless the medical adviser has had some personal experience or gleaned information from reliable sources, he must feel a certain amount of difficulty in furnishing a satisfactory reply. Although there are libraries of books on Egypt containing elaborate observations on the climate, it is very rare that these have been utilised for the direct benefit of the traveller in search of health. The following notes are therefore brought together with the object of pointing out in a short space what the Nile-bound invalid ought to do, and ought not to do, in a land where the habits and requirements of Europeans are not so well understood as at home.

The strong and healthy in quest of pleasure and novelties may rush up the Nile by steam-boat, or proceed at leisure by the native craft fitted out expressly for the foreign tourist. There is another description of traveller, who, although in delicate health, is not so indisposed as to require a companion. This individual often proceeds to Egypt,

in expectation of being enabled to join one of the many boat-parties at Alexandria or Cairo. This undertaking requires, however, to be carried out with a considerable amount of discretion, inasmuch as it has not unfrequently happened that weakly persons have overtaxed their strength by associating themselves with parties proceeding entirely for shooting; indeed, at best, this is a haphazard mode of securing the full benefit of the climate, and cannot be recommended unless the programme is satisfactorily arranged beforehand.

With reference to the time of arrival and departure, the Nile voyager will do well to take the swallow as his guide; that is, he should arrive in Egypt about the middle or end of October, and leave the country before the end of April.

The hotel accommodation is ample, but to the invalid there is not that amount of comfort which will induce him to remain long—at all events in Alexandria; he should therefore proceed without delay to his Nile-boat, which may be easily procured either at Alexandria or at Cairo. But as we are studying the requirements of the invalid, to whom a boat-voyage is preferable to a Cook's ticket or the steamer, the plan likely to agree best with his condition is not to engage either boat or dragoman until he arrives at Cairo, where abundance of boats are waiting to be hired.

There are different ways of striking a bargain. First, by the trip—that is, by arranging with the dragoman to take you at a fixed price to and from the First or Second Cataract, as the case may be, allowing a certain number of days to view the antiquities on the way. By this plan, it is evident that the traveller is left entirely at the mercy of the dragoman, whose interest it is, of course, to get through the journey as soon as possible. This mode of procedure may suit the strong, but at best it is not to be recommended, on the principle, that no arrangement ought to be entered into that does not make the traveller his own master on board. Another plan is to hire a boat by the month or by the trip, and provision it one's-self. This, however, is a troublesome business, and cannot be performed but by persons accustomed to travelling in that particular way, or who are disposed to take the trouble, and possess strength to make the necessary purchases in the crowded streets and bazaars. A third method is to settle with the dragoman at so much per diem; and considering the usual description of couriers and cooks, this is unquestionably the most desirable plan; at the same time, it should be distinctly noted in his contract, that he is not to require any delay for provisioning unless at the usual stated places on the river where stores are replenished. The invalid will, of course, communicate with the dragoman as to the articles he desires; and it would be well to see that they are on board before sailing. European provisions, such as wine, beer, preserved meats, sago, &c., are procurable in either city at high prices, which, of necessity, influence the charges of the dragoman.

There are few guide-books on Egypt which do not enter fully into details regarding the probable expenditure of a Nile voyage, now, unfortunately, becoming more expensive. So much is this the case, that it may be a question for consideration with the doctor how far his patient is likely to receive the benefit desirable, at the price usually

paid nowadays for the hire of Nile boats; at the same time, few who have made a tour of the river, and noted the advantages of the climate, but will hope that the time may not be distant when the Egyptian climate will be available for thousands of poor invalids who cannot now enjoy its advantages.

With reference to the dragoman, it is of essential importance that he should be of reputed good character; and it would be well if the invalid could find out the names of the best Maltese and Egyptian dragomans beforehand, for the reason that great deception is often practised, more especially with reference to testimonials of competency. The boat selected should be carefully overhauled, to see that, for instance, the *satarra* (outside curtain) covers all the windows, which ought to fit properly, as they are apt to become loosened by the heat. There is an object, also, in seeing that the furniture is complete. Boats are preferable which have a cushioned and canopied seat outside in front of the saloon, where the inmates can sit when the wind or sun prevents their going on deck. This arrangement, as we will see presently, is invaluable to the delicate, especially during the cold northerly winds in January and February.

As to the crew, who have often heavy work in towing the boat, it is imperative that on an average they should not number less than ten able-bodied men. A cook-boy is usually added; and a large boat will require as many as fourteen sailors, including the captain or *rais*. These may seem trifling points; nevertheless, much of the invalid's comfort depends on them.

In making arrangements with reference to messing, the invalid ought not to omit a daily supply of buffalo cream, or *geshteh*; it is very nourishing, and is a good substitute for the native butter, which cannot be recommended.

Many invalids suffer on arrival in Egypt from the change of food and habits, and a great blame is attributed to the Nile water; at the same time, little account is taken of other adjuncts in the way of unwholesome food and fruit. The best advice that can be given to the invalid will be, to live sparingly for the first few days after arrival, and imitate as much as possible the food and modes of cooking to which he had been previously accustomed, attending carefully to the first signs of bodily derangement. With these precautions, he may safely drink the well-filtered Nile water, which is cool and delicious.

Before starting, it will be advisable to hang about in the river for a day or two, to see that all is right, and especially that the boat is made comfortable, and that the provisions have been put on board, inasmuch as the dragoman is generally disposed to take everything for granted.

Although the river-scenery is constantly changing, there is often considerable sameness; at all events, a supply of books is a desideratum. The naturalist may converse with Nature's charms, and view her stores unrolled; the draughtsman will have ample scope for his pencil, and may feast his fancy among the noblest of Old World ruins. These can be easily visited on donkeys; a lady and gentleman's saddle being usually part of the dragoman's outfit; and here let us caution the delicate to beware of the cold and sometimes mephitic air and draughts in many of the temples and tombs. For example, the temple of Abou

Simball in Nubia, and the Tombs of the Kings at Thebes, are dangerous resorts for persons with weakened air-passages.

As to clothing, the invalid ought to carry supplies of light and warm descriptions, which he may be required to doff and don, often twice during the day. Unless well wrapped up and under an awning, it is not advisable for very delicate persons to leave the saloon after sunset. During November and the three following months, dew falls profusely at night all over the Valley of Thebes after 9 P.M. It is, however, dispersed before 9 A.M., and in the form of fleecy cirri may be seen floating at high altitudes in an otherwise clear and delightfully serene atmosphere. The dew almost vanishes in Nubia, above the First Cataract, in consequence of the close proximity of the desert to the river. Thus the climate, from being moist, as in Egypt, becomes exceedingly dry in Nubia.

Travellers sometimes sail at night when the wind is favourable; but as time ought to be no object, the preferable plan is to halt at dusk and start after breakfast. By this means the sick enjoy all the scenery, and are saved the annoyance of the creaking helm at night. The boat should be so placed that the morning sun will shine on either the star-board or port side for two hours before the patient arrives in the saloon, the latticed windows of which have been raised, and the outer curtain rolled up; the object being to dispel the sharp morning air, by no means an insignificant precaution. But it will be found that invalids with susceptible air-passages—and they constitute more than one half of the winter sojourners on the Nile—who have experienced the comfortless feeling of getting out of bed and dressing with an Egyptian north wind blowing through the boat, will fully appreciate this recommendation. Again, on the downward voyage, when Boreas blows sharply, the stern windows should be covered with the satara, and the boat allowed to drift stern foremost whilst the patient is seated in the cosy nook in front of the saloon. A comfortless boat, without a satara, and full of draughts from badly fitting doors and windows, obliges the invalid to shut himself up during windy weather, and thus the full benefit of the climate is in a measure lost.

The grand advantage of the Egyptian climate in winter, is its daily serenity and sunshine. However strongly the wind may blow, a sheltered corner after breakfast-time will always be a sunny one. To persons, therefore, with delicate lungs, it is a matter of no little importance to be aware of this circumstance, and to be enabled at the same time to utilise a few simple measures of protection against the asperities of the weather.

The climates of Upper Egypt, Nubia, and the desert are, from their superior dryness, far better suited for certain lung diseases than the damp atmosphere of the Delta and cultivated tracts of the low country; much, however, depends on the condition of the patient, who must consult with his medical adviser on this point. The climate of the Nile Valley in Nubia is much drier than that of Lower Egypt; whilst the sharp bracing air of the Nubian Desert is often trying to the very delicate. The experience of years suggests to the patient, that provided benefit is obtained by the voyage to the First Cataract, he will do well to push on to the Second Cataract,

and tarry in Nubia as long as the weather will permit. He may return to Assuan towards the end of February, and bask for a few days among the sunny creeks of the rapids, where he will enjoy the fine scenery and a delightful climate. If equal to the exertion, he can stroll among Philæ's interesting ruins, and anchor the boat in the sheltered nook just under the grand temple of Æsculapius—no unsuitable place for the invalid who feels the better for his Nubian tour. Indeed, if his gratitude for the art which has been the means of suggesting remedial measures for his good has any tendency to eccentricity, he may imitate the ancients, and there and then sacrifice a cock at the Temple of Health, where, doubtless, many an ancient Egyptian had offered up similar oblations.

Before drawing our remarks to a close, there is one bit of advice we have reserved for the physician, and that is, to find out from his patient, before deciding on the Egyptian climate, whether or not he is one of the idle, cheerless, and unhappy beings who has no resources within himself. To such a person the Nile voyage will soon become tedious and, most likely, unprofitable. Indeed, it often happens that invalids of this description find themselves worse instead of better at their journey's end; moreover, even persons in rude health who have no active pursuits, mental or bodily, get soon tired of the monotony of the boat-life and a hum-drum existence which savours little of the enjoyments of home. On the other hand, he or she who can combine instruction with amusement, need seldom know a dull moment.

In concluding these few observations on the climate of the Lower Nile, from a sanitary point of view, there comes to us this hope, constantly suggested by incidents of travel in the Land of Plenty—namely, that the day may come when we will see European dwellings among the palm-groves of Siout, Thebes, Syene, Wadec, Halfih, &c., and hundreds of enfeebled constitutions gaining new life and vigour from a winter residence in sunny Egypt.

## FLITTERMOUSE WELL.

### IN TWO CHAPTERS.—CHAPTER II.

ONCE in the open air, I was not long in hurrying away from Blackness, feeling more repugnance to Janet Horwood than ever; but all the way home her face haunted me, and her words kept ringing in my ears. What had I done to deserve her warning? She must have imagined, I at last concluded, that I had tampered with the letter I gave to her father; and it did not detract from my dislike of the girl to feel that I had merited no such suspicion. It was a few nights after my visit to Blackness, that I chanced to go earlier than usual to my rendezvous at Flittermouse Well. It was a dark and cold night, but I cared little for that, and concealed myself as usual to watch. Presently—yes! did I not see in the black darkness a gray something moving! I held my breath; and a minute after the bright rays streamed out as before round the edge of the well, and the outline of a bending figure came between me and the light. I had resolved that night, that if the apparition came again, I would rush out and challenge it. The

moment was nearing; I would wait but a few seconds longer. I waited, and the figure moved. It seemed to be twining something in its long arms. What did it mean? Surely it must be some spell, some weird incantation. I gazed fascinated, whilst the wreathing arms went on twining and winding. The eerie notes of the screech-owl fell on the stillness of the night, and the bats—from which the well derives its name—whirled closer and closer round the light. At length the movement ceased, and there followed a pause. The figure appeared to bend far over the brink, then a second figure rose slowly from the well's mouth. This was too much for my feelings. 'Be it ghost or be it man,' I muttered, 'I am determined to find out what it is;' and springing up, I rushed impetuously forward and clutched at the gray figure. The shock caused it to come in collision with the other form I had seen, and at the same moment I heard a muttered oath, and then fell back, stunned by a blow dealt heavily against my chest.

When I awoke to consciousness, I also awoke to a sensation of pain. I must have been a considerable time on the grass, for though the morning had not dawned, the moon had risen, and the first objects on which my eyes rested were the swaying willow branches. For some time I was at a loss to collect my thoughts; until, on stretching out my hands, I felt a precipice on one side of me, and on the other the dewy grass. This brought me to myself, and I found that I was lying in a perilous position close beside the well, with my feet hanging over its brink. With some difficulty, owing to the pain in my chest and the weary numbness of my limbs, I managed at length to rise; and the remembrance of the night's events returning to my mind, I peered into the well. It looked dark and fathomless as ever; but attached to the roots of the willow which hung over its mouth was a coarse rope, knotted together so as to form a rough sort of ladder. Several of the strands were broken, but it had evidently been used to assist some one to ascend or descend. Probably the second figure I had seen had just clambered up by it, when I caused so sudden and fell an interruption. So I thought; and I furthermore came to two conclusions. First, that ghosts would neither use rope-ladders nor administer such substantial blows as the one I had received; and that they must therefore have been human beings with whom I came in contact. Secondly, that I had most probably precipitated both, by my violence, to the bottom of the well. A horrible thought succeeded these reflections. They might be both lying there now, *dead*; and if so, I was their murderer!

These ideas were too dreadful for me; a motive of concealment led me to take the next step—namely, to collect all the clods and bits of broken earth which lay scattered about the grass, and throw them, together with the rope-ladder, to the bottom of the well. Then, without waiting to hear the sound of their fall, I fled, as fast as the pain in my limbs would allow me, away down the hill to my home. Arrived there, I crept in, as I had so often done before, at the casement, closed it, and scrambling into bed just as I was, drew the bed-clothes tightly round me, and remained there until the morning. What a night I passed! I shudder now

when I think of it. At last, when morning dawned, I fell into a heavy slumber; and when I awoke, it was past noon. Unable to bear the weight of my solitary thoughts, I then crept down-stairs. I found an unusual stir in the generally stagnant household. My grandfather, Deborah, and even my aunt Barbara, were all talking of some stirring events, tidings of which had just been brought them by a man riding across country from Blackness to G—. These events, as far as I could gather, were as follows.

It appeared that at daybreak that morning there had been a fray between the smugglers and the preventive men, aided by Farmer Horwood and other farmers and peasants. It had ended, after a long conflict and pursuit—as it often did end—in the escape of all the smugglers' gang. As the farmer and his men were passing along the shore on the way home, however, they had heard groans, as of some one in great pain, issuing from among the rocks hard by. On following the direction of the sounds, they found, not far from the mouth of a small cave, one of the leaders of the smuggling party, whose absence at the late conflict had been remarked. The man was lying on the ground in a helpless state, and it was supposed that he had fallen over some obstacle on his way through the hidden recesses of the cave. On finding whom his groans had summoned, the poor fellow made a desperate though vain resistance, and was at length forced to yield to his captors, who bound him, and then proceeded to search further, in the hope of finding some of his associates. Instead of this, what was the farmer's horror, on perceiving the form of his daughter Janet lying insensible upon the rocky floor, with a terrible wound across her face! The poor father, not knowing what to think or how to act, had both Janet and the prisoner conveyed to Blackness Farm, where their wounds were dressed by the surgeon, who was always at hand on the occasion of an engagement with the smugglers. On being restored to consciousness, the first thing which met the eyes of Janet Horwood was the lifeless form of the smuggler, who still lay where he had been set down in a state of insensibility. Supposing him dead, she uttered a piercing shriek, and breaking from those around her, threw herself down beside him, murmuring words of passionate grief and endearment. The father's horror at the confirmation of his worst fears can be better imagined than described. The girl was forcibly torn from her lover—for such the smuggler was—and, had it not been that the doctor positively forbade her removal until she should be sufficiently recovered to bear it with safety, the enraged parent would have cast her forth from his house at once. As it was, he denounced and disowned her with bitter words. In spite of many efforts, neither threats, entreaties, nor exhortations could force from the miserable girl one word concerning what had passed; and it was the same with the smuggler when at last he came to himself. (It was afterwards discovered that Janet had long been in the habit of meeting this man under cover of darkness, at Flittermouse Well, when he delivered into her safe keeping some of the contraband goods which fell to his share, receiving in exchange food and other necessities, which helped to support him and his comrades whilst they remained in hiding in the caves along the shore.)

Whilst Deborah was circumstantially detailing

to me all these events—with that delight in horrors characteristic of her sex and position in life—a dreadful horror and reproach had been gradually creeping over me, which caused a cold dew to gather on my forehead, and a violent fit of trembling to seize my limbs. Deborah, not being observant, noticed neither of these symptoms, though I could scarce find breath to falter out the question: 'What do you think will be done to the man?'

'He will be transported for life,' was the ready answer, 'if he is not hanged.'

'But why? He was not concerned in the fray.'

'He has been chief leader of many a one before this,' answered Deborah; 'and if he was not concerned in this one, it was because he couldn't be, having broken his leg. If ever a man deserved a sentence,' she added vindictively, 'he will.'

At these words I turned away with a sick heart, not caring to hear more. The rest of the day I passed wretchedly enough. It was clear to me that my ghosts of the preceding night were Janet Horwood and the smuggler. In my sudden mad violence, I must have caused them both to fall to the bottom of the well, from which they had crawled—wounded as they were—along the subterranean passage to the entrance of the cave. Here, probably, they were overcome with weakness, and were consequently discovered, as has been described. I was not, then, actually a murderer, as I had at first dreaded; but was not what I had brought on almost worse than death? Better death than a lifelong disgrace and banishment from home! Better, far better death than transportation for life! So I owned to myself that I should have thought in my own case.

Even now, I could not rest without having made sure that Flittermouse Well was tenantless. Towards evening, therefore, as it grew dark, I provided myself with a lanthorn and some string, and set out in that direction. All was silence and gloom at that ill-omened spot. Cautiously and fearfully I lit my lanthorn, and tying it to one end of the string, lowered it gently down the well. Down, down it went to the bottom, shewing the ground strewn with fragments of turf and the rope I had cast there, but nothing more. I returned home with my former convictions strengthened—to rest, but not to sleep.

For days and days I was haunted by the thought of Janet Horwood and the smuggler; the more so when I learned—about a month after the events I have related—that the former had been expelled from her father's house, and that the sentence of transportation had been carried out upon the latter.

It is a curious fact, that in all my wanderings, whilst my mind was thus disturbed, my feet involuntarily led me each day to Flittermouse Well, where I would stand gazing at the scene of these adventures which had ended so tragically. One day, being drawn there as usual by some irresistible impulse, a circumstance occurred which put a stop to my wanderings on the Dunmoor Hills for many years. I had been gazing into the gloomy depths of the well, as was my custom, when I became conscious of a presence near me, and looking up, I saw a face which made my heart leap with terror. It was the face of Janet Horwood, but how changed since last I saw it! It seemed as if a more than human expression of malicious hatred glared now from

those black eyes, and a livid scar, that had scarce healed, crossed one temple and cheek. I stood fascinated, taking in all these details; I even remember noticing, with an additional thrill of horror, that she wore a long cloak of duffel gray, when she drew near and stood before me, tall and erect.

'What brings you here?' she asked in a low stern voice. 'How dare you revisit the scene of your cowardly wickedness. Is it not enough that you have ruined two lives, but you must come here and gloat over the remembrance! Begone! and beware,' she added slowly and impressively, 'how you cross my path again.'

There was something so dreadful in the suppressed anger of her tone, and in the look she fixed on me, that, added to the remorse I felt for the harm I had unintentionally done her, caused me to sink on my knees before her. 'I—I thought it was the ghost,' I stammered—the gray ghost. I meant no harm.'

'The ghost, the gray ghost!' repeated Janet in a sneering voice. 'You thought it was the ghost, did you? You had better beware for the future of the ghost of Flittermouse Well!' And so saying, she turned, and left me as suddenly as she had come.

Before another month had elapsed, I had run away from my home at the manor. I felt that I could not stay any longer in the neighbourhood of Flittermouse Well. The events that had occurred had so wrought upon me, that I determined to leave my dreary home and all that could remind me of the past; and, contrary to what might have been expected, fortune befriended me. I managed to obtain money enough before another year had passed to pay my passage to Australia, whither, as it happened, many emigrants were just then bound.

My relations did not trouble themselves much about me, apparently, for years passed without my hearing either of them or of Dunmoor. I tried to banish from my memory all that had happened; and set to work to earn money. Fortune favoured me again; young as I was, I succeeded well in sheep-farming; and at the age of thirty I returned with my young wife to England, a comparatively rich man.

On my return, I would not suffer myself to revisit the scenes of my childhood; and I never mentioned the circumstances I have here related to any one.

Years passed on, and I lived happily with my young wife, whom I dearly loved; all the wild imaginations of my youth having been effectually quenched in the prosaic process of gaining a livelihood. My happiness seemed complete when a son was born to me. I had now an heir to my savings, and on this child I centred all my interest. He thrived as well as I could desire; and for the space of two years all went smoothly. At the end of that time there fell on me a blow which nearly crushed me.

One evening I had just returned from a long journey, and was walking home from the coach-office, eagerly looking forward to the meeting with my wife and child, when, as I neared my own house, I noticed a woman standing by the gate, muffled in gray. I had to pass quite near to her, and as I did so, she uncovered her face and turned it full upon me. It was old and changed, but there was no mistaking that look of deadly hatred,

once seen, never to be forgotten, and a glance sufficed me to recognise the face of Janet Horwood. Involuntarily, I hurried through the gateway, and when I cast a look behind me, the figure had disappeared. A gloomy foreboding had now come over my heart, which reasoning failed to dispel. I hastily knocked at the door of my house; it was opened, and I learned the fatal tidings that my boy was dead and buried. A sudden attack of illness had come on, the nurses said, and after a few hours of suffering he had died. They had sent an express messenger for me, but I was already on my journey home—a journey of several days, and the message failed to reach me.

The foreboding I had felt was now accounted for; but if I had my suspicions concerning the cause of my child's death, I kept them to myself. My wife and I could not bear to live where our darling had died, so we left our home, and removed to a distance.

After another year had elapsed, my wife again presented me with a son, and, freed from old associations, I held up my head once more and rejoiced. Mother and child both did well, and in my new joy I kept jealous guard over my boy, never stirring from the house till my wife was well enough to come down-stairs. Even then it was only urgent business that took me away from home for a few hours. In the evening I returned, and on my way home I was pondering on my new treasure, when I encountered a woman, who turned as I passed and looked me in the face. It was Janet Horwood again. This time rage mingled with my horror, and I sprang towards her; but she eluded me, and vanished from my sight.

My old forebodings returned tenfold, and I entered my home with a sinking heart. My footsteps echoed like sounds of doom through the silent hall. Breathing thickly, I passed up-stairs, and opened the door of my wife's chamber. She was lying on the bed with her back towards me. I approached her. Our baby lay on her arm. I bent over her, and kissed her. Her face was cold. I listened for her breathing: there was no sound. Mother and child were both dead.

Medical evidence was given that they died from the effects of a strong poison; but there was no evidence to disclose the murderer. Suspicion fell here and there, but without proof. I was myself accused of having done the deed; but I was acquitted. I believe every one thought that my mind was deranged by what I had gone through.

I do not know what has impelled me to write this history. The same influence, perhaps, that has caused me, a broken-hearted man, to return to the now deserted manor, and that leads me every day to the brink of Flittermouse Well. I write it in the old oak-panelled dining-room; and some impulse urges me to bring it to a close to-day—the wind in the sycamores moaning a dirge meanwhile.

I was at the well this morning; a heavy rain had fallen in the night, and all was silent and deserted. The willow branches were dripping, and the long grass was soaked and dank. Yet I saw traces of footsteps which must recently have been imprinted; and close to the well's mouth there lay an old, worn cloak of gray druffel—not sodden by the rain, but as though it had just fallen there. By these tokens, and by a strange presentiment in my heart, I think that Janet Horwood is not far

off, and the same presentiment warns me that we shall meet once more.

After reading the singular history I have given above, I made inquiries in the neighbourhood respecting the former tenants of Dunmoor Manor; and was told that they were respectable farmers, who had made it their home for many years. As there was nothing tragical to be told in connection with them, I concluded that the writer of the above narrative must have belonged to a family of older date. I made further inquiries, therefore, and discovered that a family of the name of Roche had possessed the manor long ago; that the proprietor had died, and the rest of the family had deserted the house, and gone no one knew whither; that after this, the house had remained untenanted for many a year, until at length a member of the family—an old man, and reported to be insane—had returned there.

'And what became of this old man?' I asked of my informant.

'Well, sir,' was the answer, 'the tale runs as how he was found lying dead at the bottom of an old pit hereabouts.'

'And the name of the pit?' I inquired eagerly.

'Flittermouse Well.'

#### FEMALE NAIL-MAKERS.

A NUMBER of years ago, when visiting Birmingham, we were not a little horrified at seeing women, said to be mothers of families, working at forges with anvil and hammers at nail-making. There they were, grimy and imperfectly clothed, toiling at an employment which we had been accustomed to think was suited only for men. It was a sickening sight. So much has been done of late to meliorate the condition of women—for one thing, they are not allowed to work in coal-pits—that we imagined female nail-making was a thing of the past. It turns out that such is not the case. In what is called the Black Country in England, nail-making by females goes on the same, if not worse than ever; for the appetite for drink and a love of idleness among certain classes of workmen aggravate the condition of their wives, and, as matters go, women are obliged by family necessities and other circumstances to take to the hammer and anvil. Surely, this is a grievous social wrong, deserving of a prompt remedy.

We glean the following sad facts on the subject from the Report of Mr Baker, Inspector of Factories. The Report embraces extracts from the testimony offered by Mr Sub-inspector Brewer, on the nail and chain making district, and refers to the half-year ending with April 1875.

'From both the nail and chain trades there are strong representations made against the labour of women, whether as to the numbers employed or the size of the articles made. The women are said to take the place of fathers as well as of husbands, while the men are idle and drunken. So difficult, too, are some of those shops to find that the same place may be passed many times, and only be discovered at last by the merest accident. . . . "I thought this was a free country," was a remark

which greeted me as I entered a nail-shop in the outskirts of a large manufacturing town. I inquired what was the matter now, and was answered: "Do you call this a free country where women are employed in such trades as these are here?" I replied I had again and again discussed this question with working-men around me, and I am now continually asked whether I cannot do something to stop women's labour, especially in and around Halesowen, where "hundreds" work (making the large nails or spikes) is the order of the day, and is far fitter for men's work than women's.

"The root of all the evil in the Black Country appears to be drunkenness, no matter whether the drinker be puddler, collier, chain or nail maker. The outcry against the colliers' and puddlers' wives working is very great; not, perhaps, so much from their influx into the trade, but from the fact that they work night and day, and toil and slave—and for what? Not for the price that straightforward masters would give, but for any price any crafty knave of a master chooses to offer. These people work and do not stand out for "tommy" and "beer" so long as they can get something to satisfy their half-starving families; while the ought-to-be bread-winner is luxuriating in some public-house at his ease in "training his whiffet" for some future running, on beef-steaks and the best of good fare. Day by day I am more and more convinced that this woman's labour is the bane of this place. Nor do I confine this remark to the nail and chain trade alone. It was only the other day that a young woman, addressing me, said: "I say, master, I wish you would make my man do a little more work, and me less. I married a swell, I did." On my inquiring what she meant by a swell, she replied: "Why, when I married him in the morning, he had a smart gold watch and chain and a smart dickey; but when we came to go to bed at night, I'm blessed if he had e'er a shirt on, and ever since I've had to keep him by working in the brick-yard, and not only keep him, but find him money to drink."

"Nor is this state of things confined to the Black Country. At Bromsgrove I heard also of the growing custom of idle, lazy young lads looking out for skilled industrious wives in order to obtain an easy life. Things go on smoothly for a time; but then come children, and perhaps sickness, and the idle hand of the legitimate bread-winner has lost its craft, or a course of drunkenness has so debilitated him that he can no longer stand the fatigue and heat. While the mother toils and slaves, the children are left uncared for, to wander shoeless and in rags, till they are old enough to blow the bellows for their father at a miserable pittance per week—to be kicked and cuffed, hear filthy, indecent, and blasphemous language, and are then sent into the shop amid men degraded by drink and gambling, in time to follow the same course. Take, again, the instance of a collier's wife in this Black Country who works at chain-making about ten hours a day, for which she is paid eight shillings, though if she had taken her work to an honest master she might have had twelve shillings. Out of this, before she can take any for herself, she has probably to pay for nursing her baby while she works, two shillings a week for her breezes,

that is, firing for her nail-making, and one shilling for the hire of her stall, leaving her half-a-crown for her subsistence. It is true, this may not be the same in every case, but in far too many it is.

"My experience is, that the chief encouragers of such labour as this are the middlemen, the foggers, and the drunkards." It is explained that 'foggers,' 'middlemen,' and 'factors' are synonymous terms for a class of men who get a living by buying nails at a somewhat cheaper rate from the working nailer, and selling them at an advance to the large masters. To these 'foggers' the improvident hasten, who live from hand to mouth. The fogger gets the advantage of all little odd quantities, as, for instance, a nailer who takes in eighteen ounces of iron would only get paid for the pound. Foggers are supposed to be greatly mixed up with truck. Mr Brewer goes on: "These 'middlemen' are a great curse to the trade, for to such the poor drunkard flies who cannot carry on from week's end to week's end, to receive the wages of a few hours' labour, and, of course, at reduced prices. The woman with a drunken husband is much in the same plight. Lots of these middlemen keep public-houses and 'tommy' shops, and carry on a system of 'truck.' Thus, if a workman would decline to spend his money at his employer's house, he gets no more work, and therefore cannot refuse; drink they must have, and drink they will have, whether they starve their families or not. It is rare to find many men at work on the first two days of the week. The sanitary condition of the shops is often bad. Women certainly work often in an advanced state of pregnancy, but then in the chain-shops most of it is hand-work, and no 'oliver' (that is, not work with a heavy instrument for welding links together).

"Not many days since, a tale was related to me by an ironmaster of what happened in a brickyard near Bilston a short time back. The manager noted a girl carrying clay looking exceedingly ill. Thinking she had been drinking over-night, he exclaimed: "Why, Clara, you don't look up to much this morning." "No more would you," was the retort, "if you had had a child during the night." Mr Baker acknowledges that this Report of Mr Brewer's is 'sensational,' adding, however: "But I have not introduced a tithe of what he and other writers have said of this Black Country. In a Report of this kind, or any kind, it is indescribable, and much must necessarily be omitted. But I believe from what I have myself seen, all that I have written is true, and I am afraid that all I should have written is true also. And the remedy? That I respectfully leave to the Royal Commissioners, before whom I have laid Mr Brewer's Report." 'Mr Baker calls attention to one possible result—namely, that as women are often obliged to use the "olivers" to weld their chain-links, &c., weakly work or occasionally bad iron may be introduced in the fabrication of cable chains, on the safe holding of which many lives may depend in rough weather at sea; and that, at all events, testing by a government official is desirable before they are trusted for such purposes.'

## FRANK BUCKLAND'S LOG-BOOK.

ALL are familiar with the name of Mr Frank Buckland in connection with matters of practical natural history, as well as with our salmon-fisheries. By his father, the late Dr Buckland, Dean of Westminster, well known for geological inquiries, he was taught to cultivate habits of observation, to take notes, and to reflect on what he saw out-of-doors or in-doors, in town or country. His tastes led him to the special study of animal life, and, with his remarkable acuteness, he has been able to accumulate an immense variety of details regarding the living creatures falling under his attention—we might say, from the tongue of a snail to the trunk of an elephant. One of the results of Mr Buckland's observations has been a work, the *Log-book of a Fisherman and Zoologist*. It is a volume full of amusing particulars concerning animals; and we confidently recommend it for general perusal. Everything is told in a light, off-hand way, with much humour and geniality of feeling.

In his preface, the author offers a hint respecting what he deems a deficiency in educational arrangements. 'The so-called education of the present day,' he says, 'is, in my opinion, too much confined to book-learning, and taking for granted the ideas and opinions of others. If I had my will, I would educate the eyes of all—adults even more than youths and girls—to observe and to photograph objects in their head. I would also teach them to use their fingers to analyse and draw, and, above all, to dissect, Beasts, Birds, and Fishes, so as to be able to understand their wonderful structure and mechanism, and the handiwork of the great Designer of all things.'

While on a visit to Herne Bay in 1871, Mr Buckland had an interview with W. Wood, a retired diver, who told some curious stories of under-water life. 'Mr Wood made his first real start in life by an extraordinary, and as it turned out, a very lucky, piece of diving. If the reader will look at the map of Ireland, he will see that outside Belfast Lough, and a little to the south-west, opposite Donaghadee, are situated the Cope-

land Islands. It so happened that a Whitstable man was a coastguardsman in this district. He heard a legend that a ship laden with a heavy cargo of silver had been wrecked off the Copeland Islands some half a century ago. He therefore communicated with some of his friends at Whitstable who were divers. Accordingly, Mr Wood and four others put their diving-dresses on board a vessel, and sailed from Whitstable to Donaghadee.

It appears that the people on board the ship had tried to escape, having first filled their shirt-sleeves with dollars; but in getting up the rocks, many of them had fallen back, and met with an untimely end, as the weight of the dollars had kept their heads under water. No one had ever disturbed the wreck since the vessel went down, so Mr Wood and his friends set to work to find out where she was.

They put on their diving-dresses, and for two or three days walked about to and fro at the bottom of the sea, in about forty feet of water, searching for the treasure. This they did by clearing away the weeds and turning over the stones with crow-bars, and feeling for the dollars with their hands, as the water was too thick to see. The wood-part of the wreck itself had entirely perished through lapse of time and the ravages of sea-worms. After a long and careful search, at last they came upon the dollars; they were mostly spread about among the stones, but many had slipped down among a heap of iron ore which had formed the ballast of the ship. Many of the dollars were worn thin by the action of the water.

When hunting among the wreck for the dollars, Mr Wood had some curious under-water adventures. One of the divers complained that he was annoyed by a lobster, and couldn't work. Mr Wood learned the whereabouts of the lobster, and went down after him. He soon discovered Mr Lobster sitting under a rock, looking as savage as a lobster can look. His feelers were pointed well forward, and he held out his two great claws wide open in a threatening attitude. Wood, knowing the habits of lobsters, offered this fellow his crow-bar, which he immediately nipped with his claws.

Then, watching his opportunity, he passed his signal-line over the lobster's tail, made it fast, and signalled to the men above to "haul away." This they did, and instantly away went Mr Lobster flying up through the water into the air above, with his claws still expanded, and as scared as a lobster could be.

'A great conger-eel also paid the divers a visit. He was an immense fellow, and kept swimming round Wood, but would not come near him. Wood was afraid of his hand being bitten, as a conger's bite is very bad. He once knew a diver whose finger was seized by a conger. The brute took all the flesh clean off the man's finger. A conger is a very dangerous animal to a man when diving in the water. However, this conger kept swimming round about Wood, so he took his clasp-knife out and tried to stab him; but the conger would not come near enough to be "knifed." It was a long while before the conger would go away; and even after he had gone away Wood could not go on working, because he was not sure that the brute was really gone for good, and he might have come out of some corner at any minute and nipped his fingers.'

Most persons would think a winter's day, with deep snow on the ground, a particularly uncomfortable time to choose for visiting such a place as the Regent's Park Menagerie. Let us see what Mr Buckland has to say on the subject. There is a science termed *Ichthyology*—the study of footprints of various animals. By the exercise of his knowledge of this subject, the Red Indian is able to track his human enemies or his four-footed prey, and the 'trapper' of North America owes much of his success in his craft to his acquaintance with the footprints left in the snow or on the soft earth by the animals that he is in search of, and whose skins are worth so much money in the London markets. So Mr Buckland tells us that one day, finding the snow thick on the ground, he determined to visit the Zoological Gardens, for the express purpose of examining footprints in the wintry carpet. How interesting those marks appear when examined with a little care!

The large webbed foot of the Arctic wolf; the broad paw of the Polar bear, with its lining of hair to prevent the animal from slipping on the ice; the padded hoof of the camel, who, with his four feet, makes only two footmarks, placing his hind-feet exactly in the spots vacated by the fore-feet—all these and many others leave their characteristic tracks in the snow, which serve to throw some light on the construction of the animals, and their adaptations to the various conditions of their existence. But how many people could have traced to their origin the following peculiarly puzzling marks? Going his round of inspection, he tells us: 'For a considerable distance along the snow, on the right-hand side, there were a series of semicircles; on the left hand, simply some gashes cut pretty deep into the body of the snow; between the marks, there was a straight

line cut somewhat deeper.' These mysterious marks were the prints left in the snow by a goose, whose left wing had been cut, while her right wing remained intact. The poor bird had been making an attempt to fly. The semicircular marks were the beatings of the wing which had not been clipped, as it swept the snow backwards like an oar. The gashes on the left hand were the markings of the wing which had been clipped. The track in the middle was made by the bird's feet.

Of that interesting species of cuttle-fish, the Octopus, the author has much to say, having made the specimen in the Brighton Aquarium his especial study. The following passages, which include some amusing observations upon crabs and rats, are characteristic of Mr Buckland's easy colloquial style: 'The octopus tank at Brighton,' he informs us, 'is in fine order, and it is interesting to see the curious and hideous creature feed. He evidently has good eyesight. The moment a crab is dropped in from above, he spies it from his lurking-place, and out he comes like an ogre from his den; he spreads his great tentacles all round in a circular form, and pounces down on the poor crab, inclosing him in the membrane which connects his eight arms together at their base. The crab has not a chance of escape from this umbrella-shaped covering thrown so suddenly over him. He is instantly seized and devoured; but we have not yet seen the process of devouring. The poor crab seems to know his danger; he has probably never before seen an octopus, yet he is afraid. If I were a crab I should certainly be afraid of an octopus. I wonder if crabs have nerves, and if some crabs have pluck, while others are cowards?'

'It is a great feature in human curiosity that, when a great novelist or great poet writes about an animal, the beast immediately becomes celebrated. It may itself be common enough, but when invested with a halo of mystery—and novelists and poets are generally not famed for a profound knowledge of natural history—it suddenly becomes a hero in the public mind. Victor Hugo wrote about the octopus or man-sucker. Of course, like the Yankee showman, he made his yarn "as good as he could." An octopus arrives for the first time at the Brighton Aquarium; the directors find to their joy that their new treasure fortunately becomes a subject of correspondence in the *Times*, and for many days we read a good deal about "sea-monsters." As the octopus sits in a squat position at the bottom of his tank, his head is amazingly like that of an elephant, a similarity which is fully carried out by the continual wave-like motions and curlings of his long prehensile arms. I am, in fact, rather surprised that this animal has not attained the name of "the water-elephant," a name certainly more appropriate than "devil-fish;" for he is not a fish, and there is nothing diabolical about him.

'When fishing for whiting at Folkestone, a great "man-sucker" (as the octopus is there called by the fishermen) came floating past the boat, and I put my hand and arm into the water in his way. In an instant the long arms were coiled round my hand, quick as the end of a driving-whip twists round a gig-shaft; the brute did not bite me; I almost wish he had given me a nip. In the centre

of the eight arms is the beak; this is in shape like a parrot's beak, but not nearly so hard or strong. The substance into which his beak is set is something like a bit of muscular tripe, therefore I do not think that the bite of an octopus would be so very bad. A discussion has taken place in the *Times* as to whether the octopus would seize a man or not. Certainly he would, if he got near him in the water, though not with the intention of swallowing him, but because he would seize anything moving. I do not think an octopus would come out of water to attack a man, nor would he, I think, "fly at" a man, for the octopus moves by going "stern foremost," his long arms being stretched out *behind* his head, looking like the legs of a heron when flying.'

In the midst of a tour of inspection of salmon-rivers in Scotland, the author had time to take copious notes of many natural history subjects peculiar to that country; and we consequently have interesting observations on Scotch red deer, wild cats, eagles, wild goats, and the far-famed white cattle of Hamilton and Chillingham. Most of the so-called 'useless' creatures both in Scotland and elsewhere are becoming extinct, under the combined attacks of the gamekeeper and the 'collector' of natural history specimens: wild cats, eagles, and even the finer specimens of deer and wild goats, are being rapidly killed off. No sooner is a large deer seen in a forest, than 'everybody is after the "muckle stag of Ben-something or other;" he is ultimately shot; and the breed is not benefited by the continuance of his kind.' There is sound logic in this remark, which owners of deer-forests would do well to profit by. Mr Buckland thinks that the finest deer should not be killed, but left to perpetuate their species, and suggests that the breed might also be improved by judicious crossing with the wapiti of North America. This has already been done in Germany, and would very probably be attended with beneficial results in Scotland.

But it is not merely what are termed 'vermin,' or 'useless' animals, that are killed off to extermination. On many estates, woodpeckers are shot by the gamekeepers, from a mistaken idea that they are in some way or other injurious. On the contrary, the landowners, by allowing their destruction, are depriving themselves of good friends. These birds are specially adapted for killing such insects as infest the bark and leaves of trees. Their curious claws enable them to maintain a safe hold on the trunk or branch of a tree, against which their tail rests, and affords additional support; with their long beak they can reach into the cracks and crevices of the bark; and, most wonderful mechanism of all, they have a long tongue—nearly four inches in length—which 'can be pushed back into a sheath which fits it, just as a penicil can be pushed back into a silver pencil-case:' the tip of this tongue is armed with small barbs; and the bird is enabled to pick up insects by this means with marvellous celerity. It especially searches for a beetle which bores into the sprouting tops of pine-trees, and which thereby does great injury to woodland property. By killing these and similar destructive pests, the woodpecker renders an immense service, unasked and unpaid, and is worthy of strict preservation, instead of destruction.

Seals, again, afford another and still more

striking example of the way in which animals, commercially valuable, are too often recklessly destroyed. In giving a description of the cruelties practised upon these animals in the northern seas, Mr Buckland takes views similar to those we expressed in a recent article in the *Journal*, entitled 'A Plea for the Seal.'

In 1869, the Commissioners of Works determined to clear out the bottom of the Serpentine, a piece of ornamental water in one of the London parks. This gave Mr Buckland an opportunity for obtaining various kinds of fish, which he and his friend Mr Lee (of Brighton Aquarium) transferred to the Round Pond in Kensington Gardens. The adventures of these two enthusiasts, first in getting the fish out of the Serpentine, and then accompanying their scaly treasures on *water-carts*, to Kensington, are exceedingly amusing. Mr Buckland sums up the result of his mud-larking by giving 'a catalogue of the relics which perhaps may one day become evidence of the former existence of London: Pickle bottles, wine bottles, soda-water bottles, blacking bottles, ink bottles, physic bottles, ginger-beer bottles, beer-cans, sardine cases, coffee-pots, tea-cups, egg-cups, shoes, boots, pipes without end, dogs' bones, cats' heads, akato straps, gallipots, a top of a lamp, india-rubber balls, cocoa-nut, curtain rings, a loaded shot cartridge, an iron weight. Here there is plenty of material for any one who wishes to argue out the existence of a big city and the customs of the inhabitants. If this had been the remains of a Roman camp, we should have been sure to find plenty of coins, but English people don't seem to throw their money away in the curious manner that appears to have been fashionable among the Romans. If we ploughed up an English camp, such as Aldershot, we should find that the English soldiers had dropped very few shillings or coppers; but the Roman soldiers, on the contrary, seem to have spread their money broadcast. I suppose they had no pockets in their armour. One human skull only was found near the bridge of the Serpentine; there are possibly more human bones in the mud near this "Bridge of Sighs."

Nowhere is the author's cheery happy style better exemplified than in the chapter on Snaking; and here we may remark that Mr Buckland has always looked upon snakes with extreme fascination. We append a few of his rambling remarks upon a snaking expedition at Aldermaston Park, Reading—the residence of his friend Mr Higford Burr. A large party having assembled on the lawn in front of the hospitable mansion—

"Where will you go to-day, Buckland?" said the Squire, as he gave out the orders of the day to his guests.

"Well," said I, "if I have my wish, I should like to go out 'Snaking' in the morning and fishing in the evening. It's a splendidly hot morning, and I am certain some of your snakes, which you preserve so humanely, will be out basking in the park; but we must lose no time, or the snakes will be in."

"Those who will go out snaking with Buckland will please hold up their hands; he wants beaters to help," said the Squire.

'I was delighted to find that a goodly number of recruits, ladies included, would join the snaking party. So we paraded at once. Sticks were, out to hunt for the snakes—not kill them, mind—and

the Squire and myself carried sticks fork-pointed at the end, in case we should come across a viper, as I wanted to try experiments with the fresh poison. We first drew the "Home Covert," a bank by the side of a garden wall, a favourite abode of snakes; but none happened to be at home; at least, if they were, they were among the stones of the wall. Forming a regular line, we then hunted carefully along a hillside.

After a long and unsuccessful scramble, charmingly diversified by joke and anecdote, and just as Mr Buckland had succeeded in 'bagging' a lizard, he heard the Squire's voice signalling him from the distance. 'He apologised for my want of sport in my snaking expedition, but at the same time he delighted me by promising to guide me at once to a dung-heap, where it was reported that some snakes had laid their eggs. This dung-heap was situated in the middle of a yard where the cows lived in the winter, and was just the very place snakes would choose to lay their eggs. The keeper got a dung-fork, and diligently turned over the straw at the top, while the Squire and I worked away at the sides of the dung-heap. We found an enormous number of wood-lice, little and big, and one diabolical-looking, jet-black, carnivorous beetle, with tremendous jaws. Upon the back of this beetle, curious to say, was a great bunch of creatures looking like white lice. I emptied a fusee-box, and put the beetle in, but somehow or other the brute escaped, and I believe he was alive for some days in one of my numerous pockets. Our next find on the dung-heap was a grand old toad, living in a beautiful palace all to himself, under a stone. He was evidently there to eat the wood-lice.

'I was dreadfully afraid we should draw the dung-hill blank, but at last I gave a view holloa, when, underneath a bit of the straw, I saw something of a milk-white colour. "Avancez," I said, "go ahead;" 'I'm certain that's a snake's nest.' Lifting up the straw most carefully, I was delighted to find first one, then two, then a dozen eggs. The Squire and I then proceeded to dissect out the nest with our pocket-knives and a dung-fork most carefully. Snakes' eggs are not quite so large as a blackbird's; they are round at both ends like a sugar-plum. They have no hard shell like a hen's egg, but the shell is composed of a soft elastic substance, like thin wash-leather. Some eggs were lying quite separate. The greater part were, however, stuck firmly together, so tightly that it was almost impossible to tear them apart without breaking the skin. The eggs were not held by a ligature, but appeared pasted together by some strong adhesive gum, end on end. Most of the eggs were quite distended: the shells of some, however, had fallen in, and they looked crumpled. The appearance of the eggs in this dung-heap, just as the parent snake or snakes had placed them, was so striking, that a gentleman, well known for his artistic talent, took a sketch of the egg and the nest.

'The Squire kindly allowed me to take all the eggs out of the snake's nest in this dung-heap, and I placed them under favourable circumstances in a glass bowl in my museum, to find out how long it would be before the young snakes hatched out. Some say they will hatch out in a few weeks, while others maintain that they will not do so till the following spring. Before placing these eggs in

the artificial nest, I made a cast of the whole of them, just as I found them on a portion of the dung-heap. The cast has come out well, and the group now forms a pretty illustration of natural history in my Fish museum.'

In December 1870, a telegraph cable was laid down in the sea between Penang and Singapore. It worked well until March 1871, when messages through it stopped. The fault, which was discovered in June, and repaired, was of an extraordinary nature. It appeared as if it had been bit by a fish, yet that could hardly be, as there was a hole or tooth-mark on one side only. The faulty piece being cut out, was sent to Mr Buckland, with a view to discover what sort of animal had inflicted the injury. Here is what he says on the subject: 'I confess I was exceedingly puzzled with this most difficult problem. The hole towards the spectator is two-thirds larger than it is on the opposite side. If it had been an ordinary fish, such as a shark, there ought to have been the marks of a bite on *both* sides of the cable, namely, of a tooth in both the lower and upper jaws. This wound, therefore, must of necessity have been made by a fish having but one tooth, and one tooth only; but what fish is there that has only one tooth? For several weeks I kept the specimen on my mantelpiece, and was constantly thinking over the puzzle. At last one day I hit it off, all in a minute. On going round my museum I observed with most intense interest a beak or saw of a sawfish (*Pristis antiquorum*), presented to me by Dr Day, Inspector of Indian Fisheries, the fish having been taken in the Andaman Islands. "That's the fellow," I said to myself, "that made the hole in the telegraph cable;" so, taking one of the teeth out of the beak of the sawfish, I placed a spare portion of the telegraph cable on the table, and struck the end of the tooth with the mallet, and immediately produced a wound almost, I may say exactly, similar to that found on the Penang telegraph cable. My theory is, therefore, very simple, and I think is correct, namely, that the perpetrator of the wound was a big sawfish. The cable lay quiescent at the bottom of the sea, when one day a sawfish came by, hunting for his dinner. The mode which the sawfish adopts to get his food is, I believe, by waving his saw horizontally right and left, and turning up the mud or sand in order to dislodge the delicate-bodied marine creatures on which he subsists. His teeth will tell us he cannot eat hard substances. When thus engaged in his submarine digging, the sawfish suddenly came across the telegraph cable. His beak getting entangled in it, he gave it an extra blow and a smash downwards, and finally getting enraged, hit it so hard that one of his teeth went between the outer wires—through the hempen rope—and then through to the gutta-percha, injuring the wires. These various substances probably then held the tooth somewhat tightly. The fish then struggled and broke his tooth short off, leaving a bit of it actually imbedded in the cable among the wires.' So much for natural shrewdness and a knowledge of natural history.

If space permitted, we would gladly wander on through this charming volume of curiosities, and especially advert to the extraordinary doings of the author's pet monkeys, but we think enough has been said to stimulate the curiosity of our readers. Besides furnishing amusement, and no little degree

of instruction, Mr Buckland's *Log-book* shews very conclusively what may be done by any one who earnestly, and with his eyes open, pursues investigations into the works of nature.

## THE FLAG OF DISTRESS.

### CHAPTER LI.—STARVATION POINT.

WHILE these scenes are passing at sea, others of equally exciting character occur upon that desert shore, where, by a sinister chance for themselves, if not for their captives, the pirate crew of the *Condor* made landing. They are still upon the isle, all their efforts to get off having proved idle. But how different are they from that hour when they brought their boat upon its beach laden with the spoils of the plundered vessel! Changed not only in their feelings but looks—scarce recognisable as the same men. Then in the full plenitude of swaggering strength, mental as bodily, with tongues given to loud talk; now subdued and silent, stalking about like spectres, with weak, tottering steps; some sitting listlessly upon stones, or lying astratch along the earth; not resting, but from sheer inability to stand erect.

Famine has made its mark upon their faces; hunger can be read in their hollow eyes and pale, sunken cheeks; while thirst shews upon their parched and shrivelled lips.

Not strange all this. For nine days they have tasted no food save shell-fish and the rank flesh of sea-fowl—both in short supply. And no drink, excepting some rain-water caught in the boat-sail during an occasional slight shower.

All the while have they kept watch with an earnestness such as their desperate circumstances evoked. A tarpauling they have rigged up by oar and boat-hook, set upon the most elevated point of the isle, has failed to attract the eye of any one on the main-land; or if seen, the signal has been disregarded; while to seaward, no ship or other vessel has been observed—nought but the blank blue of ocean recalling their crime—in its calm tranquillity mocking their remorse!

Repentant are they now; if they could, willingly would they undo their wicked deed—joyfully surrender the stolen gold—gladly give up their captives—be but too glad to restore to life those they have deprived of it.

It cannot be. Their victims left aboard the barque must have long ago gone to the bottom of the sea. In its bed they are now sleeping their last sleep, released from all earthly woes; and they who have so ruthlessly consigned them to their eternal rest, now almost envy it. In their hour of agony, as hunger gnaws at their entrails, and thirst scorches them like a consuming fire, they care little for life—some even desiring death.

All are humbled now. Even the haughty Gomez no longer affects to be their leader, and the savage Padilla is tamed to silent inaction, if not tenderness. By a sort of tacit consent, Harry Blew has become the controlling spirit—perhaps from having evinced more humanity than the rest. Now that adversity is on them, their better natures are brought out, and the less hardened of them have resumed the gentleness of childhood's days.

The change has been of singular consequence to

their captives. These are no longer restrained, but free to go and come as it pleases them. No more need they fear insult or injury; no rudeness is offered them either by speech or gesture. On the contrary, they are treated with studied respect, almost with deference. The choicest articles of food—bad at best—are apportioned to them, as also the largest share of the water; fortunately, sufficient of both to keep up their strength; and they in turn have been administering angels—tender nurses to the men who have made all their misery!

Thus have they lived up till the night of the ninth day since their landing on the isle; then a heavy rainfall, filling the concavity of the boat's sail, enables them to replenish the beaker, with other vessels they had brought ashore.

On the morning of the tenth, they are relinquishing themselves to bitter despair, and have called to the Dutchman—who has been posted on the heights above, on the outlook for a passing sail—to come down. A last solemn council of ways and means is to be held, and all hands must assist. But he neither obeys nor gives back response. He does not even look in their direction! They can see him by the signal-staff, standing erect, with face turned towards the sea, and one hand over his eyes, shading them from the sun. He appears to be regarding some object in the offing.

Presently he lowers the spread palm, and raises a telescope with which he is provided.

They stand watching him, speechless, and with bated breath, their solemn purpose for the time forgotten. In the gleaming of that glass they have a fancy there may be life, as there is light.

The silence continues till 'tis seen going down. Then they hear words which send the blood in quick current through their veins, bringing hope back into their hearts: '*Sail in sight!*'

### CHAPTER LII.—AN AVENGING NEMESIS.

'Sail in sight!' Three little words, but full of big meaning, oft carrying the question of life or death.

To the ears of the starving crew sweet as music, despite the harsh Teutonic pronunciation of him who gave them utterance.

At the shout from above, all have faced towards the sea, and stand scanning its surface. But with gaze unrewarded. The white flecks seen afar are only the wings of gulls.

'Where away?' shouts one, interrogating him on the hill.

'Sou'-westert.'

South-westward they cannot see. In this direction their view is bounded; a projection of the cliff interposing between them and the outside shore. All, who are able, start off towards its summit. The stronger ones rush up the gorge, as if their lives depended on speed. The weaker go toiling after. One or two, weaker still, stay below, to wait the report that will soon reach them.

The first up, on clearing the scarp, have their eyes upon the Dutchman. His behaviour might cause them surprise, if they could not account for it. The signal-staff is upon the higher of the two peaks, some two hundred yards beyond. He is beside it, and apparently beside himself. Dancing over the ground, he makes grotesque gesticulations, tossing his arms about, and waving his hat

overhead—all the while shouting as if to some ship close at hand, repeating the hail: 'Ahoy, ahoy!'

Looking, they can see no ship, nor craft of any kind. For a moment they think him mad, and fear after all it may be a mistake. Certainly, there is no vessel near enough to be hailed.

But sending their eyes further out, their fear gives place to joy almost delirious. There is a sail, and though long leagues off, little more than a speck, their practised eyes tell them she is steering that way—running coastwise. Keeping her course, she must come past the isle—within sight of their signal, so long spread to no purpose. Without staying to reflect further, they strain on towards the summit, where the staff is erected.

Harry Blew is the first to reach it; and clutching the telescope, jerks it from the hands of the half-crazed Dutchman. Raising it to his eye, he bends it on the distant sail, there keeping it more than a minute. The others have meanwhile come up, and, clustering around, impatiently question him.

'What is she? How's she standing?'

'A bit o' a barque,' responds Blew. 'And from what I can make out, close huggin' the shore. I'll be better able to tell, when she draws out from that clump o' cloud.'

Gomez, standing by, appears eager to get hold of the glass; but Blew seems reluctant to give it up. Still holding it at his eye, he says: 'See to that signal, mates! Spread the tarpaulin' to its full stretch. Face it square, so's to give 'em every chance o' sightin' it.'

Striker and Davis spring to the piece of tarred canvas; and grasping it, one at each corner, draw out the creases, and hold as directed.

All the while Blew stands with the telescope levelled, loath to relinquish it. But Gomez, grown importunate, insists on having his turn, and it is at length surrendered to him.

Blew, stepping aside, seems excited with some emotion he tries to conceal. Strong it must be, judging from its effects on the ex-man-o'-war's-man. On his face there is an expression difficult to describe—surprise amounting to amazement—joy, subdued by anxiety. Soon as giving up the glass, he pulls off his pilot-coat, then divesting himself of his shirt—a scarlet flannel—he suspends it from the outer end of the cross-piece which supports the tarpauling; as he does so, saying to Striker and Davis: 'That's a signal no ship ought to disregard, and won't, if manned by Christian men. She won't, if she sees it. You two stay here, and keep the things well spread. I'm going below to say a word to them poor creeturs. Stand by the staff, and don't let any o' them haul down the signal.'

'Ay, ay!' answer Striker, without comprehending, and somewhat wondering at Blew's words—under the circumstances, strange. 'All right, mate. Ye may depend on me an' Bill.'

'I know it—I do,' rejoins the ex-man-o'-war's-man, again drawing the dreadnought over his shirtless skin. 'Both o' you be true to me, and fore long I may be able to shew I an't ungrateful.'

Saying this, he separates from the Sydney Ducks, and hurries down towards the gorge.

Both, as they stand by the signal-staff, now more than ever wonder at what he has said, and interrogate one another as to his meaning.

In the midst of their mutual questioning, they

are attracted by a cry strangely intoned. It is from Gomez, who has brought down the telescope, and holds it in hands that shake as with palsy.

'What is it?' asks Padilla, stepping up to him.

'Take the glass, Rafael Rocas. See for yourself!'

The old contrabandista does as directed. He is silent for some seconds, while getting the telescope on the strange vessel. Soon as he has her within the field of view, he commences making remarks, overheard by Striker and Davis, giving both a surprise—though the latter least.

'Barque she is—polacca-masts. Queer. About the same bulk, too! If it wasn't that we're sure of the *Condor* being below, I'd be willing to swear it was she. Of course, it can be only a coincidence. A strange one, though.'

Velarde, in turn, takes the telescope; he, too, after a sight through it, expressing himself in a similar manner. Hernandez next—for the four Spaniards have all ascended to the hill.

But Striker does not wait to hear what Hernandez may have to say. Dropping the tarpauling, he strides up to him, and, *sans cérémonie*, takes the telescope from his fingers. Then bringing it to his eye, sights for himself.

Less than twenty seconds suffice for him to determine the character of the vessel. Within that time, his glance taking in her hull, traversing along the line of her bulwarks, and then ascending to the tops of her tall smooth masts, he recognises all as things with which he is well acquainted.

He, too, almost lets drop the telescope, as, turning to the others, he says in a scared but firm voice: '*The Condor!*'

'*Condor!* Impossible!' cry the four Spaniards, speaking together.

'It is, for all that,' rejoins Striker. 'How so, I don't understand' any more than yourselves. But that yonder craft be the Chili barque, or her spectre, I'll take my solemn affydvay.'

Striker's speech calls up strange thoughts, that take possession of the minds of those listening to it. How could it be the *Condor*, long since scuttled—sent to the bottom of the sea? Impossible! The sail seen must be a spectre!

In their weak state, with nerves unnaturally excited, they almost believe this—one and all impressed with wild weird fancies, that strike terror to their guilty souls.

Something more than mortal is pursuing to punish them. It is the hand of Vengeance. For days they have been thinking so, and now they see it stretching farther, and coming nearer. Clearly a Fate—an avenging Nemesis!

'It's the barque, beyond a doubt!' continues Striker, with the glass again at his eye. 'Everythin' the same, 'ceptin' her sails, the which shew patched-like. That be nothin'. It's the Chili craft, and no other. Her, sure's we stan' heer!'

'Stay!' exclaims Gomez. 'Where are they who took charge of the scuttling? Can they have blundered in their work?'

Remembering the men, all turn round, looking for them. They are not among the group gathered around the staff. Blew has long ago gone down the gorge, and Davis is just disappearing into it. They shout to him to come back. He hears; but, not heeding, continues on, and is soon out of sight. It matters not questioning him, and they give up thought of it. The thing out at sea engrosses all their attention.

Now nearer, the telescope is no longer needed to tell that it is a barque, polacca-masted; in size, shape of hull, sit in the water—everything the same as with the *Condor*. And the bit of bunting, red, white, blue—the Chilian ensign—the flag carried by the barque they abandoned. They remember a blurred point in the central star: 'tis there!

Spectre or not, she is standing towards them—straight towards them—coming on at a rate of speed that soon brings her abreast the islet. She has seen their signal—no doubt of that. If there were, it is before long set at rest. For while they are watching her, she draws opposite the opening in the reef; then lets sheets loose; and, squaring her after-yards, is instantly hove to.

Down drops a boat from the davits; as it strikes the water, men seem swarming over the side into it. Then the splash of oars, their wet blades glinting in the sun; as the boat is rowed through the reef-passage. Impelled by strong arms, it soon crosses the stretch of calm water, and shoots up into the cove. Beaching it, the crew spring out on the pebbly strand—some not waiting till it is drawn up, but dashing breast-deep into the surf. There are nearly twenty, all stalwart fellows, with big beards—some in sailor garb, but most red-shirted, belted, bristling with bowie-knives and pistols; wearing tall boots, with trousers tucked in at their tops—the costume of the California gold-digger.

Two are different from the rest—in the uniform of naval officers, with caps gold-banded. These, though the youngest, seem to command, being the first to leap out of the boat; soon as on shore, drawing their swords, and advancing at the head of the others.

All this observed by the four Spaniards, who are still around the signal-staff, like it, standing fixed, though not altogether motionless: for they are shaking with fear. Their thoughts, hitherto given to the supernatural, are not less so now. Even more, those of Gomez and Hernandez. Incomprehensible to them the *Condor* being afloat; but to behold among the men who have just come out of her two they well know. For in the officers leading, De Lara and Calderon recognise their detested rivals, in love—the same who made smash of their monté bank!

For some moments, De Lara stands in sullen silence, with eyes dilated. He has watched the beaching of the boat, and the landing of her crew. Recognising the officers, he clutches Calderon by the arm. Now more vividly than ever is their crime recalled, for now its punishment is near. There is no chance to escape it. To resist, will only be to hasten their doom—sure to be death. They do not think of resistance, nor yet flight; but remain upon the hill-top, cowering and speechless. Calderon is the first to break silence, frantically exclaiming: 'The officers of the English frigate! Mystery of mysteries! What can it mean?'

'No mystery,' rejoins De Lara, addressing himself to the other three; 'none whatever. I see it all now, clear as the sun at noonday. Blew has been traitor to us, as I suspected all along. He and Davis have not scuttled the barque, but left her to go drifting about; and the frigate to which these officers belong has come across, picked her up—and lo! they are there!'

'That's it, no doubt,' says Velarde, otherwise

Diaz. 'But those fough fellows with them don't appear to be men-of-war's-men, nor sailors of any kind; more like gold-diggers—the same as crowd the streets of San Francisco. They must have come thence.'

'It matters not what they are, or where from. Enough that they're here, and we in their power.'

At this Diaz, and Padilla, now known as Rafael Rocas, step towards the cliff's edge to have a look below, leaving the other two by the staff.

'What do you suppose they'll do to us?' asks Calderon of De Lara. 'Do you think they'll—'

'Shoot, or hang us?' interrupts De Lara; 'that's what you'd say. I don't think anything about it. One or other they'll do, to a certainty.'

'Is there no chance of escaping?' piteously exclaims the ex-ganadero.

'None whatever. No use our trying to get away from them. There's nowhere we could conceal ourselves; not a spot to give us shelter for a single hour. For my part, I don't intend to stir from here. Yes; I shall go down to them, and meet death like a man. No; like a tiger. Before dying, I shall defend myself. Are you good to do the same? Are you game for it?'

'I don't comprehend you,' answers Calderon. 'Who would you fight against?'

'Whomsoever I can. Two for certain.'

'Which two?'

'Crozier and Carmen. You may do as you please. I've marked out my pair, and mean to have their lives before yielding up my own—hers, if I can't hit. She shan't live to triumph over me.'

While speaking, the desperado has taken out his revolver, and holding it at half-cock, spins the cylinder round, to see that all the six chambers are loaded, with the caps on the nipples. Sure of this, he returns it to its holster; and then glances at his *macheté*, hanging on his left hip. All this with a cool carefulness, which shews him determined upon his hellish purpose. Calderon, quailing at the thought of it, endeavours to dissuade him; urging that, after all, they may be only made prisoners, and leniently dealt with. He is cut short by De Lara crying out:

'You may stifle in a prison, if it so please you. After what's happened, that's not the destiny for me. I prefer death and vengeance.'

'Better life and vengeance,' cries Rocas, coming up, Diaz along with him, both in breathless haste. 'Quick, comrades!' he continues; 'follow me! I'll find a way to save the first, and maybe get the last, sooner than you expected.'

'It's no use, Rafael,' argues De Lara, misunderstanding the speech of the seal-hunter. 'If we attempt flight, they'll only shoot us down the sooner. Where could we flee to?'

'Come on; I'll shew you where. Courage! Don't stand hesitating; every second counts now. If we can but get there in time!—'

'Get where?'

'To the boat.'

On hearing the words, De Lara utters an exclamation of joy. They apprise him of a plan which may not only get him out of danger, but give revenge, sweet as ever fall to the lot of mortal man.

He hesitates no longer, but hastens after the seal-hunter, who, with the other two, has already started towards the brow of the cliff. But not to

stay there; for in a few seconds after, they are descending it—not through the gorge by which they came up, but another, also debouching into the bay.

Little dream the English officers, or the brave men who have landed with them, of the peril impending. If the scheme of the seal-hunter succeed, theirs will be a pitiful fate: the tables will be turned upon them!

### THAMES PIRATES.

THE back windows of my lodgings overlook the Thames, and many an hour I pass watching the ceaseless traffic below. For reasons I shall explain, Grabbum of the detective force has been staying in the floor above me; and being anxious to learn some of the experiences of that astute officer, I ventured the other evening, through the medium of Betty, my worthy landlady, to request the pleasure of his company in my parlour. We were soon in close confab; but Grabbum told me candidly that he had been pumped nearly dry of his experiences, and that he did not like to find the truths he gave to writers used merely to spice a lot of stuff, into which they dragged a woman, who always, against all justice, got the worst of it. He was now employed, he told me, by the master lightermen of London to discover a confederacy of water-pirates of the Thames, and bring them to justice. Even while with me he was on duty sitting at the window.

'It is nothing to what it was before the docks,' he remarked. 'All the docks have been made since 1800; and when you know that these docks cover an area of nine hundred acres, and all the shipping previously used to discharge their cargoes in the main river, you may guess what a body of water-rats the waifs and strays would bring together. Why, sir, the West India Docks alone have had fifty thousand pipes of rum, and eighty thousand barrels, and five hundred thousand bags of coffee, and fourteen thousand logs of mahogany—yes, and twenty-two thousand tons of logwood, in them at a time!—What do they do with the logwood? Well, that's neither here nor there. There are three thousand labourers employed in the London Docks. Fifteen thousand pipes of port, and thirteen thousand hogsheads of sherry. Look at that! The Commercial Docks pay one thousand pounds a year to remove the deposit of mud which is caused by the continual churning of the Thames by the steamers. In former days, the rafts of timber used to be left high and dry on the banks of the river, and there was a regularly organised gang of fellows, with some rich City people at the head of them, whose avocations were to cut the ropes during the night which bound these "sticks" together; and when the tide rose, the separated logs would float off, be picked up, and either kept, or salvage claimed upon them. In all the villages along the banks of the Thames and Medway, there were persons perpetually occupied in untwisting the cordage of the royal navy, to take out the silk-thread put in to identify it; others were employed in effacing the broad arrow stamped on all the metal materials used in the arsenals; and at the failure of one celebrated shipbuilding yard, no less than twenty-four marine-store shops were shut up simultaneously: a practical illustration of the enor-

mous extent of the pilfering that was going on in that one spot.

'Do I think there is much robbery now in the docks? No; it is confined within a certain limit. At one time, any man who knew his way about could buy a tasting order for twopence or so, and go down some of the vaults in the London Docks, wait for one or other particular cooper, and drink as much of the best—not the wine specified in the order, if that was inferior—the finest brands; until it has been known that certain butts and pipes have been so tapped as to leave but little in them when the merchants sent to pay the duty and remove them. This practice received its death-blow when it was discovered that gentlemen had been lured into these vaults, treated with wine, which they could imbibe to a great extent in the equalised atmosphere of the cellars, but which, upon their ascending into the open air, took effect upon the brain, permitting them to be led to some concerted rendezvous of thieves in the neighbourhood, and there ill-treated and robbed.

'The thieves on the Thames are known by distinctive names, and they keep pretty much to their especial departments. The tip-toppers are regular river-pirates; then there are heavy and light horsemen, game-watermen, game-lightermen, mud-larks, scuffle-hunters, and copemen. The river-pirates consist of the boldest and most desperate of the robbers; they carry on their operations in the night against all vessels badly watched, and whose crews are sometimes murdered, and thrown overboard, that the vessel may be the more securely pillaged, and detection avoided.'

'May I ask if you are now watching for anything of that kind?'

'Yes,' returned Grabbum, 'I am waiting here for four of these fellows, who are sure to fall into my hands, perhaps before the week is out; but it is only a matter of time. More frequently, these chaps confine themselves to taking the cordage, oars, poles, and bales of merchandise. The captain of an American brig, hearing a noise, went on deck to look out: he saw a boat row away, and found they were pirates, who, wishing him good-evening, told him that they had just parted his cable; and of course he was adrift. Having an understanding with the watchmen charged with taking care of the cargoes at night, they plundered with the greatest facility. When they cannot effect such collusions, they cut the cables of the lighters, and let them float until they get to a place where they can effect their object without any fear of discovery. Small coal-barges have been found entirely emptied during the night. Russian tallow, which, from the difficulty of moving the enormous barrels containing it, would seem to be safe, is not so; for an instance, I know of the nocturnal removal of seven of these casks, each weighing between thirty and forty hundredweight.

'The light-horsemen also plundered during the night, but principally those vessels coming from the West Indies. This species of robbery arises from a concerted plan between some of the crew and the receivers who buy the scrapings; that is, the samples of sugar, the refuse of the coffee, or the drippings of the spirits, which remain in the hold when the cargo has been discharged. It is an easy matter to increase these by piercing the casks, and loosening the hoops of the barrels. This, a Canadian merchant, who sent a great deal

of oil annually, discovered to his great astonishment. Always finding a deficit much greater than could arise from common leakage, and unable to arrive at a satisfactory solution from his correspondents, he determined on making a voyage to London, to penetrate the mystery. Resolved to pursue his investigations with the most minute research, he was on the quay waiting with much impatience for a lighter, laden from his ship on the previous evening, and whose delay seemed very extraordinary. At length it appeared, and the merchant saw a pack of fellows of very bad appearance jump on board with as much eagerness as a crew of corsairs into a prize. He went down into the hold, and was completely stupefied on seeing the barrels placed with their bungs downwards. When they began to unload the lighter, he found as much oil left floating in the hold as would fill nine barrels. The proprietor having had a few planks taken up, there was found more than enough to fill five casks; so that the load of one lighter had made a diminution of fourteen barrels. It would be scarcely credited that the crew, far from being ashamed of this, had the impudence to assert that they had a right to it, as a perquisite that belonged to them.

'Not content with these thefts, the light-horsemen, united with the lightermen, opened, during the night, barrels of sugar, which they entirely emptied, carrying them off in black bags which they call "black straps." In one night there has been carried off from various vessels as much as twenty hogsheads of sugar; also rum, drawn by means of a pump called a jigger, and conveyed away in bladders. The ships on board which this traffic is carried are called "game-ships." At this period the robberies of liquors and spirits were, besides, very common even in the royal navy. A well-known and remarkable instance occurred on board the *Victory*, which brought to England the dead body of Lord Nelson. To preserve the remains, they were put into a puncheon of rum. On reaching Plymouth, the puncheon on being opened was entirely empty and dry. During the voyage, the sailors, very certain that the purser would not visit this cask, had drawn up all the rum by straw pipes or jiggers. They called this "tapping the admiral."

'The "game"-boatmen on board vessels are those who, unloading the cargoes, abstract and carry off all stolen goods. As they are the parties who treat with the receivers, the eye of the police is constantly upon them. Yet they make a profitable business of it, and spend a great deal of money. I knew one, Tom Nelson, who kept a handsome house and a brougham, out of this traffic.

'The mud-larks are those lads who grope about the shores at low-tide, or under the bottoms of vessels, pretending to look for old pieces of cord, iron, coals, &c., but, in fact, to receive, and conceal various articles thrown over to them by confederates.

'The scuffle-hunters are workmen with long aprons who pretend to ask for work, go in a body on shipboard, and find opportunities of stealing during the confusion.

'Last of all are the receivers, who, not content with buying all that the thieves bring to them, sometimes have understandings with the captain, the pilot, or some of the crew, whom they may find not indisposed to deal with them. These

transactions are made in slang terms, intelligible only to the parties concerned. Sugar is sand; coffee, beans; pepper, small peas, &c.; so that they could deal for any portion of the cargo in the presence of the supercargo of the ship, whilst he was not aware that it was his cargo that was being the subject of the intended robbery.'

'But, my good friend,' said I, 'how do these fellows get over those in charge of a ship; say, the pilot?'

'Did you not know, sir, that a pilot could be bought over? Well, it is, to the credit of their craft, not very common. I was once after a strong gang of river-thieves. I knew that one Tim Brown was a leading man amongst them. He was in the employ of a respectable firm of lightermen (one of my patrons). A smart fellow was Tim, and above all suspicion—but mine. I knew most of his "runs," and one was the *Weeping Gridiron*. I found him in the parlour there one day. He chaffed me—the owdacious scamp!—for being a Thames policeman.

"There are fellows," says I, "who are treading with nailed shoes upon gunpowder; I know their names, their haunts, and their intentions."

'The fool then sprang to his feet and dared me to name one of them. I walked quietly up to him and whispered *Monarch* in his ear. His jaw fell, and the blood forsook his face, and he tottered out of the room. One of the gang was a certificated pilot. He was to arrange that he should go on board the *Monarch*, which was richly freighted, and bring her on to the shallows opposite the Kentish marshes—the spot to be indicated by a certain light from the shore. The weather looked dirty at the mouth of the Thames, and the captain asked the pilot whether they had better go up the river or lie to. The pilot was for proceeding, which was likewise the captain's wish, as the vessel was under demurrage; so he promised the pilot additional pay to carry the ship safely to Gravesend. About midnight, the captain, who would not quit the deck, spied some lights which were strange to him, on the port side, and asked the pilot what they indicated. The pilot feigned ignorance. The speed of the vessel was slackened, when the lookout announced a boat off the starboard bow. The next moment, I and my lads—picked men—swarmed on deck. The captain's astonishment was great; but I at once declared the purport of my errand. The captain was indignant, and spoke of being under the protection of the pilot. "If this," said I, "is the *Monarch* from Calcutta, captain, I take temporary command of her, and my first act in office is to seize Botley."

"You are a parcel of maniacs," cried the captain in a rage. "Botley is the pilot."

"Really, captain," I rejoined, "you must let me have my own way here. This honest pilot in another few minutes would have run you aground, and those lights ahead tell him exactly where, and the river-pirates would have been on board like bees. Indeed, I can hear them now coming. Listen! There is no time to lose. Muster your men, and arm them at once: there will be some blood spilt here."

'The men were shortly ready for anything, with the captain at their head; myself and men being so disposed as to cut off the retreat of the gang. They came up the sides of the ship using coarse language,

and rendered more murderous with rum, cutlass or pistol in hand. Great was their consternation when they found that they had been outwitted. Some were wounded, or driven overboard, while the rest implored mercy. Chief amongst the last was Tim Brown, whom I made my particular prisoner. I was sorry for Tim, and would have done him a good turn if I could. He was the son, by the first wife, of a baronet of good family, but had been badly brought up. I wished to save him if I could. It was to be otherwise: he was tried and sentenced to twenty years' penal servitude.'

### A RAILWAY ADVENTURE.

I NEVER saw such a change in a man in my life ! When we last met, Jack—well, I must not give his real name, considering what I am going to relate, so I'll call him Jack Pallant—was, as he had ever been since I knew him, one of the lightest-hearted, cheeriest fellows in the world, full of fun, and up to everything, and as gentle and tender as a woman, with the courage of a lion. And now, what did I find him ? Even though but three months had elapsed, he had become a grave, dejected, saddened man ; in a word, hardly recognisable, either mentally or physically. I was shocked, and of course he saw that I was. He came to see me, indeed, the moment he heard I was in town, that I might learn from his own mouth what had happened, instead of at second-hand.

Jack had always been more or less a spoiled boy—only sons are always more or less spoiled—and having lost his mother when quite a child, it was not wonderful that his poor old dad made much of him. But he had taken the spoiling kindly, and, beyond making him perhaps a little idle and thoughtless, it had done him no harm. There was no vice in the fellow ; he spent more money than he should, but many young soldiers do that, without coming to much grief in the long-run ; and his father, a soldier before him, regarded the failing leniently, paid his bills, and looked pleasant. Beyond adding that he was a rather short, dapper little fellow, I need not say much more about him ; I have only to try and put into coherent shape the strange and tragical business which had so fearfully altered him. His account of it was so disconnected, and so faltering at times, through the emotion which the recital cost him, that I make no attempt to reproduce his story in his own words. It all happened in a railway carriage ; and though we have had enough and to spare of tales of murders, robberies, strange meetings, ghosts and lunatics, which have had a railway carriage as their place of action, I venture to believe that there is still something novel in the circumstances which led to my friend's sad transformation.

He was coming to town one autumn evening for a few days' leave from Gunnersholt, where he was quartered. I can see him as plainly as if I had been there, springing into the first carriage that

offered room, without regard to who was in it ; for he was the least fastidious of men, without the slightest particle of 'haw-haw' pride and nonsense, or that stand-off-ishness of manner, too usual with men in his position ; ready to make himself happy wherever he was, or in whatever company. Fond of talking to everybody, liking to draw them out, as he said, and studying character with the full conviction that there was something to be learned from everybody ; chaffing and laughing, or sympathising and helping according to the occasion. Why, I have seen him helping a mother or nurse with half-a-dozen children in charge, as if he had been a Paterfamilias, dandling the baby, or chucking it under the chin, or squeaking at it, tickling the little boys under the ribs until they went into fits, or making the little girls laugh with his comical stories and humorous ways. Quite at variance, indeed, was the private life of Jack Pallant with that of the ordinary British soldier ; his brother-officers were oftentimes aghast at his proceedings, until they came to know and like him. Therefore, I say, I picture him taking the first seat that offered, and ready to talk to any one in the carriage who would talk to him.

But it so happened, it appears, on this occasion that he got into an empty carriage ; at least he thought so, for it was twilight, and he did not observe for the first moment the figure of a woman, seated in a farther corner, dressed in dark clothes, and thickly veiled.

The sudden discovery that he was not alone rather startled him for a moment, and it may be, as he said, that the evening before having been a guest-night at mess, his nerves were not quite up to their usual tone. He was not the lad, however, to be long in such a situation without making some remark to his fellow-traveller, though in this case an unusual hesitation to do so came over him, owing to her mysterious appearance and extreme stillness. The between-lights of the carriage-lamp and the evening sky prevented him from discerning details ; but there she sat, perfectly rigid, and with not a vestige of her face visible, through the thick black veil.

'Ahem ! ahem !' he said at last, shifting one seat nearer to her and nearly opposite ; 'I hope I have not intruded on you ; I thought the carriage was empty. I may be disturbing you, I fear.' He would say anything, in a random sort of way, to break the ice, as he called it.

No answer. A long pause. 'Very singular,' he thought ; and he moved to a seat exactly opposite to the figure, making another commonplace observation. No response, or any movement.

'Asleep, I suppose,' he said to himself ; and he sat, quietly watching her, whilst the train rattled on for a mile or two. A station was reached, and a stoppage made, with the usual accompaniments of screech, and whistling, and slamming of doors, but without producing any change in the posture of the occupant of the opposite corner. The train again moved on. 'Can't be asleep,' he muttered.

'What's the matter with her?' The window was close shut; he let it down, with a tremendous clatter and bang, remarking, that 'he hoped as the evening was fine, the weather warm, and the carriage close' (for he declared to me there was a peculiar odour hanging about which struck him from the first), 'she would not object to a little air?'

Still, no reply. Then he said: 'He feared she was not well; would she like him to pull the bell for the guard, and have the train stopped again?' But nothing he could say or do elicited any sign of life from her.

Jack now became seriously uncomfortable and alarmed on her account. He thought she could not be asleep, but had fainted. Suddenly, it crossed his mind that she was dead! Night had now closed in, but as the last tinge of twilight faded from the sky, the carriage-lamp gained its full power, and revealed every object more plainly than hitherto.

Jack leaned towards the motionless form. A long black veil, falling from a close-fitting hat-like bonnet, enveloped nearly the whole upper part of her figure; indeed, on close inspection, it hardly looked like an ordinary veil, but more like a large thin black silk handkerchief. Her dress was of common black stuff, much worn and frayed, from amidst the folds of which appeared the ends of a piece of rope that must have been fastened round her waist; and one hand, encased in an old ill-fitting black glove, lay placidly on her lap.

Full of uncomfortable sensations, Jack was about to lift the veil, when, for the first time, the figure moved; its other hand stole slowly from beneath the folds of the dress, and the veil was gradually lifted, and thrown up over the head.

Involuntarily my friend shrank back into the corner of his seat, for a face was revealed to him which no one could have looked upon without a sense of awe. It was that of a woman somewhat past middle age, thin, haggard, and pale to a degree which only death could parallel. The features, finely chiselled and proportioned, shewed that at one time there must have been supreme beauty, whilst, though the iron-gray hair looked a little dishevelled and unkempt, the glance of the eye was steady, calm, and determined.

In this glance lay, chiefly, the awe-inspiring expression of the face, for, in addition to the penetrating look, there was a persistency in it, and at the same time a fascination, quite terrible. It fixed itself upon Jack from the first moment that eye met eye, and for several minutes not a word was spoken on either side. Presently, however, he tried to pull himself together, and to assume his usual light-hearted manner, which had thus for a minute been so strangely and unusually disturbed, and he said briskly: 'I beg your pardon; I was afraid you were ill.'

She slightly bent her head, but spoke not a word, nor withdrew her glance.

He felt more and more that it was costing him an effort to be himself. Her slow, stealthy, albeit lady-like demeanour added greatly to the effect already produced, and a curious sensation was gradually creeping over him, that—impossible as it might seem—that face was not strange to him. Little as he, with his temperament, was given to speculation or introspection, he found himself striving to look back for some event or circum-

stance in his life which might give him a clue. Had he ever dreamed of such a face, or had he seen it in childhood? He was puzzled, affected, quite put out. And still the deep penetrating eyes were fixed on his, piercing as it were into his very soul. And the hands! what were they doing? Taking off the gloves as with a set, deliberate purpose; and the long white, thin, almost claw-like fingers worked strangely and nervously, slowly closing and opening upon the palm, as if preparing to grasp something.

Again, he strove to throw off the unpleasant, unusual sensation which had crept over him.

'I can't stand this,' he thought; 'I was never so uncomfortable in my life! I must do something, or say something to put a stop to this, to make her take her eyes off me!'

He moved abruptly to the farther corner of the carriage, and to the same side on which the woman sat.

'I'll try and dodge her in that way,' he said to himself; 'she shall not sit and glare at me in this fashion!'

But she too immediately shifted her place, and, rising to her full height, which was very great, went, over to the seat exactly opposite to him, never for one single second dropping her eyes from his. He looked out of window with a vague notion of getting out of the carriage; when suddenly, passing a little station which he recognised, but at which the train did not stop, an idea struck him—an idea after his own heart—a comic idea! He availed himself of it on the instant, and assuming an ease which doubtless sat ill upon him, and which he was far from feeling, he pointed with his thumb back towards the station they had just passed, as he said mysteriously in a hollow voice: 'Do you know that place?'

She seemed to answer in the affirmative by a slight inclination of the head as before.

'Ah! you do. Good! Longmoor,' he went on; 'then I don't mind telling you a secret.' He paused. ('I'll frighten her,' he thought.) 'Criminal lunatics,' he said aloud; 'I am one of them. I have just escaped from there!'

He leaned forward, as if to impress her with his words; she also bent forward until her lips almost touched his ear, as she hissed into it: 'So have I!'

With what had already gone before, this put the finishing touch to Jack's uneasiness of mind. It was not, as he said, the mere presence of the woman, or the revelation which his joke had elicited, which scared him, though the circumstance in itself might be unpleasant enough.

'I should have faced it right away from the first, as any man would have done, had it not been for the remarkable influence her face and look had upon me; that unaccountable feeling that she was no stranger to me, it was, that unnerved, and even appalled me.'

No sooner had she uttered the words, 'So have I,' than Jack sprang to the cord communicating with the guard's van, for he felt their truth, and saw in them a key to the whole mystery. But ere his hand had reached the cord, she had seized him round the waist with one arm as with the grip of a vice, and at the same instant he felt one of those terrible hands at his throat.

Every effort to release himself was fruitless; her strength seemed superhuman, and was as far

beyond his as was her stature. Her face glowered close down upon his now, still with the same fell expression. 'The only thing I could have done,' went on Jack, in describing the scene to me—and just here, he shall speak for himself: 'the only means by which I might perhaps have made her relax her hold would have been by aiming one or two tremendous blows with my right fist (which was at liberty) at her face. Had it been a man's, there would have been no hesitation; had it been indeed that of an ordinary woman, at such a pass I should not have hesitated to strike her, to stun her, if I could, by any means; but that face—that face, that I seemed to know so well, yet so mysteriously, I could not raise my hand against it, and, as my arm swung up with the first impulse, to deal her a blow, it fell helpless by my side. Vain were my efforts to get her hand away from my throat; there was a terrible swaying to and fro for a minute or two, I felt the grip of the long fingers tightening, and myself choking. Suddenly we fell, the whole carriage seemed to be falling—there was a fearful jerk or two, a strange upheaving of the floor, a tremendous rattle and crash—I appeared to be thrown headlong to some great distance, and—all was darkness!'

The termination of that deadly struggle was brought about in a manner as marvellous and unlooked for as could well have been imagined.

Some fifty souls, say, were travelling in that train; all, save one, in apparent security. Jack's life alone was in danger, when, lo! by one of those marvellous coincidences which do happen at times in the supreme moments of existence, the rescue came, but at the cost of many a life, which, but just before, would have seemed worth treble the purchase of Jack's.

At the very instant that his might have depended upon another tightening grip or two from the hand of a maniac, a frightful catastrophe occurred to the train. The tire of an engine-wheel broke, and half-a-dozen carriages were hurled down a steep embankment. The scene that succeeded is, unhappily, of too common an occurrence to need more than a word of reference here. Seven passengers were killed outright; double that number slightly or badly hurt; the remainder escaping, as by a miracle, with nothing worse than a severe shaking.

My friend was amongst the shaken. He had been thrown clear of the debris, on to a soft grassy spot, half-bank, half-hedge; emphatically, his life was saved!

But what followed it was that which caused the suffering, that wrought the terrible change in Jack.

In the darkness of that soft autumn night, he strove, foremost amongst those who had been spared, to render such help as was possible to the less fortunate. When the official assistance came, and fires were set blazing to give light, almost his first care was to try and seek out his dangerous fellow-traveller. In the confusion, nobody was prepared, of course, to listen to Jack's account of her, even had he been prepared then to give it. She was not, evidently, moving about amongst the crowd; he assured himself of that; but supposing her, like himself, to have escaped injury (and he concluded that this was likely), might she not, with the stealth and cunning incidental to her malady, be hiding, and by thus farther

eluding detection, become, with her homicidal mania, as dangerous to the community at large, as some fierce, wild animal would be? The thought made him shudder; he must lose no time in assuring himself of her fate.

As soon as an approach to order could be evolved out of that awful chaos, he had convinced himself that she was not amongst the injured. Then he turned to the dead. His eye fell upon several mutilated and motionless forms, which had been laid in an ominous row at the foot of one part of the embankment; hers was not amongst them; he could find no trace of her.

At length, as a sickly dawn was beginning to make the search easier, he endeavoured to discover the spot where the carriage he had occupied had fallen, and to retrace his steps (quite to the rear of the train, by the way) to the place where he found himself lying after the catastrophe. By this time he had made known briefly to some officials that a woman was missing, who had been in the carriage with him, and one or two of them followed him in his quest. Presently he realised pretty well where he had been thrown; he all but identified the spot. Then he scrambled through the hedge, and there, on the opposite side, on the sloping bank of a ditch, he beheld, lying quite still, her dark unmistakable form. He ran forward, and bending over her, and looking down upon the marble, upturned face, saw at a glance that there was nothing dangerous about her now; those terrible eyes were closed for ever! Except for a slight wound on one temple, whence a little blood had trickled, and the distorted but now rigidly closed hand, which had been so lately at his throat, she looked as calm and uninjured as if she were merely sleeping, whilst death had restored for a brief period much of that beauty, the traces of which had struck him when her veil was first lifted.

One of the surgeons here came hurrying up, in answer to a summons. 'Good heavens!' he exclaimed; 'here she is, then, at last! Why, she must have been in the train. How on earth did she manage it?'

'Who is she?' inquired Jack earnestly, with a strange return of the old inexplicable sensation. 'Who is she? You appear to know her. Pray, tell me.'

'Oh, one of our inmates: she got away yesterday morning; no one knows how,' was the answer.

'You are from Longmoor, then. How long has she been there? What is her name?'

'Oh, she has been there upwards of twenty years, I believe; long before my time.'

'And her name?'

'Upon my word, at this moment, I can hardly,' went on the doctor, mechanically passing his fingers over one of the pulseless wrists before him, and with a calm hesitation which contrasted strongly with Jack's earnest impetuous manner—'I can hardly remember. I think she was committed for the murder of her own little girl. It was a sad case, I know.—Ah! her name; I have it,' went on the doctor suddenly: 'her name was Pallant—Rachel Pallant.'

Jack sprang from the kneeling posture in which he was, as if he had been shot. Why, that was his own dead mother's name! But pshaw! what of that? Well, it was rather a startling coincidence; that was all! Ay, but was it all? Indeed, no.

The inquest led to a revelation. That inquiry fully explained what had been the nature of the influence which the weird pale face and strange presence had had upon my friend.

The strong but subtle link which no time or absence can quite sunder, existing between mother and son, had made itself felt the instant those two sat face to face, for the unhappy woman was indeed none other than Jack's own mother!

He had never been told; in fact, it had been carefully kept from him: why run the risk of clouding for life that bright and happy temperament? He was only four years old when the dreadful business happened. Hence he had scarcely known a mother's care; she was lost to him, to the world, as completely as if she had died. Nay, death would have been a mercy by comparison, and it was generally assumed that she was dead; only a few very intimate friends knew the truth. The poor lady's mind had given way suddenly after the birth of a child, who did not live. Within a week, the homicidal mania possessed her: by the merest chance she had been prevented from committing some frightful outrage upon her little boy, my poor friend Jack; and restraint not having been put upon her in time (for her malady had hardly been suspected, so unlooked-for was its appearance), she consummated her deadly propensity upon her eldest child, a girl, fifteen years of age: killed her, in a word, as she lay asleep.

And here, after a lapse of twenty years, was the climax and end of the tragedy, as dreadful as anything that had gone before. The order for release, when it came, brought with it as much suffering (to all but one) as had the order for captivity. No wonder that Jack was an altered man: I have never seen a smile on his face since—though I trust that time, with its healing influence, may at least soften the blow.

#### A NEW PAPER-MAKING MATERIAL

It is perhaps not generally known that but for the large importation of esparto, a species of tough grass, from Spain, to be used in paper-making, great difficulty would long since have existed in producing the enormous quantity of paper now required by the ever-increasing demands of the press. Though inferior to rags in the manufacture of the article, esparto is excellent as an auxiliary, and the possibility of procuring it has been a consolation to paper-makers. Alas! there now comes a pinch. The demand for esparto has been the death of it. We have all heard of that infatuated proceeding, familiarly known as 'killing the goose that laid the golden eggs.' The Spaniards who had the supply of esparto have killed their 'goose.' Instead of cutting their esparto with scythes, so as to leave it to grow a fresh crop, they have habitually pulled it up by the roots, and according to last accounts, whole districts of country were desolate. The esparto was gone. So much for reckless mismanagement. A great source of traffic is dried up, or very nearly so.

We need not waste words on the folly committed by Spanish esparto growers and collectors. They are deaf to remonstrance, and past pity or hope of improvement. Leaving them to their

wretched poverty and ruin, the question we have to consider is how we are to find a due supply of materials for the paper-manufacturer? The mountain plateaux of Africa, as we understand, would yield a good supply of esparto, but it is of inferior quality, and much cost and trouble would be incurred in bringing it to any sea-port. Accordingly, it has to be given up, and we must think of something else. In contemplation of the exigency, Mr Thomas Routledge, of Sunderland, has been seriously considering the subject of cheap substitutes for esparto, and has alighted on what he thinks will answer the purpose. The article is bamboo. In a pamphlet entitled *Bamboo, considered as a Paper-making Material* (London and New York: E. and F. N. Spon), he has just made known the result of his investigations and experiments. Fortunately for the paper-trade, he says, and its supply of materials in the future, two *raw fibrous substances* exist, to one of which his pamphlet is chiefly devoted.

From time immemorial, several varieties of fine paper have been made from bamboo in China and Japan, and this induced Mr Routledge to enter upon some experiments to see if it could not be advantageously utilised, although it had previously been tried with results which, commercially speaking, were not a success. Mr Routledge believes that, with his new system of treatment, bamboo will prove to be as superior to esparto in every respect, as esparto was found to be superior to straw, and he has accordingly patented his invention. The following is a brief sketch of the way in which he proposes to deal with bamboo for the manufacture of fibrous *paper-stock*: 'First and foremost, it is essential to operate on the stems of the plant when young, and preferably when fresh cut. Brought to a factory in this condition, the stems are passed through heavy crushing rolls, in order to split and flatten them, and at the same time crush the nodes. The stems are then passed through a second series of rolls, which are channelled, or grooved, in order further to split or partially divide them longitudinally into strips or ribbons; these being cut transversely into convenient lengths by a guillotine-knife or shears, are delivered by a carrier, or automatic feeder, direct to the boiling-pans. Both the boiling and washing processes ordinarily in vogue for producing *half-stuff* or *semi-pulp*, Mr Routledge conducts in a battery, or series of vessels connected together by pipes or channels, furnished with valves or cocks, so that communication between the vessels may be maintained, disconnected, and regulated as desired, in such manner that the vessels being methodically charged in succession, the heated lyes (composed of caustic alkali) can be conducted from vessel to vessel. The lyes are thus used again and again (each successive change or charge of lye carrying forward the extractive matters it has dissolved from the fibre with which it has been in contact) until exhausted or neutralised (when they are discharged), fresh lyes being methodically and

successively supplied, until by degrees the extractive matters combined with the fibre have been rendered sufficiently soluble, when hot water for washing or rinsing is, in the same continuous manner, run from vessel to vessel, until the extractive matters rendered soluble by the previous alkaline baths have been carried forward and discharged, leaving the residuary fibre sufficiently cleansed. A final cooling-water is run on and through the fibre, which is then drained, and the contents of the vessel are placed in a press, in order to abstract as much of the remaining moisture as possible. The dry or semi-dry fibre is then submitted to the action of a 'willow' or 'devil,' by means of which it is opened or 'teased' out, and converted readily into a tow-like condition, when it is dried by a current of heated air, induced by a fan-blast, and finally baled up for storage or transport. In this condition of *paper-stock* it may be kept for an indefinite length of time without injury; and when received by the paper-manufacturer, it has only to be soaked down and bleached, in order to fit it for making paper, either by itself or as a blend with other materials. It may here be mentioned that the *brochure* of which we are speaking is printed on paper made by the author from bamboo.

To turn Mr Routledge's invention to practical account, it will of course be necessary to form plantations of bamboo in those countries where it flourishes and grows untended, with almost inconceivable rapidity; and, further, to erect there the works and machinery requisite for the manufacture of the *paper-stock* just described, because, owing to its bulk, and the consequent cost of carriage, it will never pay to bring bamboo to this country in any other form.

The second material which, in Mr Routledge's opinion, fulfils the main conditions demanded by a paper-manufacturer, is 'megasse,' or 'begasse,' the fibrous residue of the sugar-cane after it has been crushed to extract the juice. This, when 'properly prepared, affords a strong, nervous fibre, or fibrous stock, which bleaches well, and possesses all the characteristics of a first-class paper-making material.' For obvious reasons, megasse would also have to be 'converted into a fibrous stock at or near the sugar-factory where it is produced, then dried, and put up in hydraulic-pressed bales for economical transport.' At present, megasse is only made use of as fuel in the sugar-factories and in some countries as manure. 'As its value, thus considered, is very low,' Mr Routledge thinks that 'factories established in connection with existing sugar-mills for the manufacture of paper-stock, where sufficient quantities of so bulky a material could be concentrated, and where other favourable conditions exist (of which an abundant supply of water is an essential), would yield a large profit to the planter or sugar manufacturer; indeed, he has 'made both paper-stock and paper of good quality from megasse, and determined the profitable nature of such a manufacture beyond dispute.' It may be interesting to mention here that bamboo and megasse yield sixty and forty per cent. of fibre respectively.

As Mr Routledge alludes to it in commenting on the present position of the paper-trade in relation to the supply of raw material, we shall perhaps be pardoned for adding a few words with regard to the attempt which has been made to utilise wood

as a material for paper-manufacture, but which has not turned out well. Wood has been tried in two different forms, the one mechanically, and the other chemically prepared. In the former case, pieces of wood, as cut from the tree, are reduced, by means of a grindstone, to pulp, or to the condition of flour; this pulp or flour, however, contains but a small amount of 'fibre, and that fibre possesses very little *felting* property, an essential for a good sheet of paper; so that it can only be used as, in point of fact, a kind of adulterant in the manufacture of the commonest papers. Of wood chemically prepared, Mr Routledge remarks that it is 'costly in production, as it is only possible to reduce it into pulp by boiling under very high pressure with very strong caustic alkali; several mills established both in England and Scotland to carry out this manufacture, have abandoned it, and such pulp as is now used in the trade is derived exclusively from the countries where the wood is grown. The pulp thus produced, although somewhat hard and harsh, if the wood be carefully selected and properly prepared, will, blended with other material, produce a fair quality of paper.' Wood-pulp, thus chemically prepared, sells (unbleached) at from L.24 to L.25 per ton, but is never likely to be used to any considerable extent.

#### A STORY OF CAPTIVES IN CEYLON.

IN the year 1659, a storm-beaten East Indiaman took shelter in Cotair Bay, Ceylon. The natives shewed such a friendly disposition, that the captain thought he could not do better than stay there to repair damages; and he and his men went ashore as often as duty permitted, feeling secure no harm would befall them. No sooner, however, was the coming of the vessel known at Kandy, than orders were sent down, resulting, not in the capture of the ship, for those on board took the alarm in time, and stood out to sea, but in Captain Knox, his son—a youth of nineteen—and fourteen of the crew, being made prisoners.

The captain, his son, and a negro boy, were allowed to remain together, but the rest were taken to Hottercourly and separated, each prisoner being assigned to a district, out of which he might not go. It was a sort of captivity made easy; as long as they did not stray beyond bounds, the captives could do pretty well as they liked, going from house to house in turn for a meal, and sleeping where they happened to sup. With sufficient to eat always forthcoming, and no work to do, Jack, not unnaturally, took it into his head that he was a privileged individual, dubbed himself 'king's man,' and claimed to be treated as a person of consequence; and when the restrictions upon his intercourse with his shipmates were removed, he proved himself, in more senses than one, a troublesome customer to his good-natured keepers. The latter had not to supply clothing for their charges, and finding themselves getting bare that way, the seamen came to the conclusion that they must pinch their stomachs for the sake of their backs. They desired their allowance of food should be

given them uncooked. This their suppliers readily agreed to; and it was settled that each man should receive a double allowance of rice, a little flesh meat, and a fair quantity of cocoa-nuts, limes, pumpkins, salt, and pepper. By selling what they did not consume, and knitting caps for sale, the Englishmen managed to live pretty comfortably. Then they insisted that if they wished to buy anything, the seller must let them fix the price; and when a potter, who could not understand the new method of doing business, assaulted a would-be purchaser, the latter actually lodged a complaint against him, and the poor potter was ordered to let the complainant have any pots he chose without any payment at all, and the sailor was authorised to give him a thrashing besides, which he did not forget to do. Soon afterwards, a wine-seller was foolish enough to decline serving a party of the Englishmen, who immediately began to help themselves. His outcry brought some neighbours to his assistance, but all they got for their pains was a good drubbing, and the satisfaction of being told, when they sought redress, that they had been very properly punished by the strangers for denying them drink for their money.

The captain, not so easily reconciled to his fate, took his misfortunes so much to heart that he died in a few months, leaving Robert Knox, his son, destitute of any companionship save that of his black boy; his only occupation angling in the brooks, his only solace the reading and re-reading of his limited library, consisting of *The Practice of Piety*, Roger's *Practice of Christianity*, and an English Bible, bought of an old Portuguese, a purchase over which he shed tears of joy. After living thus for more than twelve months, he obtained permission to roam where he listed, and was not long in discovering the whereabouts of his countrymen, most of whom had by this time set up housekeeping, taken wives unto themselves, and adopted the costume of the country. Following their example, Knox took to cap-making, and asked to have his provisions delivered to him undressed, but was told it was not fitting that a captain's son, who would one day be promoted to a place of honour, should cook his own victuals. This objection he overcame; and his house being anything but convenient, they also consented to build him another in a cocoa-nut tree plantation, but left him and his boy to finish the work, which they did; contriving at the same time to commit an offence that would have cost a native his head, by lime-washing the house, a method of decoration sacred to the palaces and temples of the land. Knox found his condition greatly improved by the change of quarters; he was able to rear pigs and poultry; his caps brought him in something; and as he was allowed all the cocoa-nuts that fell from the trees surrounding his abode, he had plenty of oil for his lamp and his cooking, without trenching on his slender stock of cash.

In 1664 the governor of Fort St George tried to obtain the release of the prisoners, his intervention only resulting in their being sent off singly to different towns, and forbidden to shew themselves near the coast. Knox, who took Fortune's buffetings with exemplary patience, at once set about making a new home for himself, and was soon comfortably established again; so comfortably,

that his Cingalese friends urged him to marry, that he might have somebody to keep his house in order, as he had parted with his boy; and thought to remove any objection he might have, by assuring him, if it so happened that he was ever permitted to leave the country, he could without offence leave wife and family behind. Although he had no intention of taking the advice, Knox promised to do so when he saw a maiden to his mind. A couple of years passed away without his finding one, and then the Dutch set up a fort not far from his domicile, and he and three other Englishmen were, without any warning, removed to Kandy Uva; Knox having to sacrifice the fruits of his careful industry, and depart as poor as he came. Nor was this the worst. He and his companions in misfortune were, in modern phrase, interned in a miserable mountain hamlet, a place to which criminals were banished, called Laggendenny. It is true the inhabitants were notified that the new-comers were men held in such high esteem at court, that if necessary they must turn out of their houses to accommodate them, and part with their goods and cattle, their wives and children, rather than allow their involuntary guests to want for anything; but the latter did not find much comfort in the compliments paid them, particularly as they were not long in learning that they were quartered in Laggendenny to punish the people dwelling there for having taken part in an unsuccessful rebellion.

After a monotonous existence in this dreary place for eight long years, Knox was allowed to migrate to the town of Elledat, ten miles south of Kandy; and on payment of five dollars he became the proprietor of a small estate, and forty-eight cocoa-nut trees. Here he and three other Englishmen set up a joint-stock establishment, each undertaking to retire from the concern upon taking a wife, and it was not long before Knox found himself with but one partner. They reared goats, poultry, and pigs; and lent out corn and rice in the husk, conditionally upon receiving at the following harvest the quantity lent, and half as much more by way of interest, and made such a good thing of it, that they were able to improve their surroundings until they could boast as good a house as any grandee in the neighbourhood. Seeing he was able to keep himself without their assistance, the Laggendenny folks declined to send in their usual supplies, and upon complaining to the official whose duty it was to see about such matters, Knox was directed in future to draw his allowance monthly, at Kandy. This led to his being ordered to appear at court; but dancing attendance there was not at all to his liking, so, after obeying the mandate once, he pleaded bodily infirmities, and was suffered to go on in his own way; but had thenceforth to depend on his own resources.

Things having come to this pass, Knox determined to get away from Ceylon, if it were possible; and upon sounding his partner, found him to be of the same mind. But it was easier to make the resolution than to carry it out; neither of them was acquainted with the country; to get any native to guide them to the sea-coast was out of the question; and they dared not make any geographical inquiries, for fear of losing the liberty they enjoyed. The most feasible plan they could hit upon was to pretend they were going on a trading expedition. Accordingly, they gathered together a stock of likely articles, and travelling

where the way led them, in three days reached the boundaries of the kingdom; but by that time they had sold all their wares, and being, therefore, without any excuse for rambling, thought it best to make their way home again. Journey after journey did they make, but with the self-same result, except that, upon one occasion, both of them fell ill from drinking unwholesome water, and they were asked by their native friends if they went to such unfrequented parts of the country on purpose that they might die. At last it seemed as if the long-hoped-for opportunity had come. Knox accidentally came across his black boy, grown into the father of a family; and he, for a consideration, agreed to conduct his old master and his friend to a Dutch settlement as soon as the harvest was over. Then, Knox, unfortunately, was not able to leave his bed, and by the time he was on his legs again, the negro had left for another part of the island, and that chance was gone.

In no way disheartened by eight years of disappointments, on the 22d of September 1679, Knox, his partner, and another Englishman, troubled with home-sickness, set out once more. After passing unscathed through 'a wilderness filled with wild elephants, tigers, and bears,' they found themselves nearing Anarodgburro; but hearing the tax collectors were busy there just then, they made a detour westward to Colliroilla. Their way lying right through the court-yard of the governor's residence, Knox, putting a bold face on the matter, desired to see the governor, and informed him he and his companions had come there in hopes of bartering their wares for dried fish, at the same time entreating his acceptance of a red Tunis cap, a parcel of knives, and some tobacco. The gifts were graciously received, and the givers assured they should have every facility afforded them to make their visit a profitable one. Here they staid sufficiently long to keep up appearances before making for Anarodgburro, beyond which place Kandian rule did not extend. At Anarodgburro they staid three days, picking up a little useful information, while they got rid of the remainder of their stock in trade. Then they gave out that they must return to Colliroilla for more goods, and were consequently obliged to burden themselves with enough provisions to last out a ten days' journey, so that with utensils for cooking, tallipat leaves for tents, calabashes for water, tinder-boxes, sweetmeats, betel, and tobacco, the fugitives were somewhat heavily laden. Clothing they had none to speak of, and their only weapons were a small axe, attached to a long staff, and a knife, which they thought would suffice to defend them against the bears and tigers; as for the elephants, they could outrun them.

The adventurous three kept to the regular road until the sun went down, when they turned into the forest, taking care, upon coming to sandy or muddy ground, to walk backwards, that their foot-prints might mislead those who chanced to notice them. At dark, they bivouacked under their tallipats until the moon rose, when, disencumbered of all superfluous baggage, they moved on, until brought up by an obstinate elephant, that insisted on barring their way, and compelled them to halt till dawn came, and the enemy retired. Even then they were not able to make much progress, for, following the windings of the river, they were brought to a village, and fearing discovery, retraced

their steps, and passed the rest of the day in a hollow tree. Darkness found them afoot once more, creeping cautiously along the river-side, working their way painfully through the forest and jungle. The journey, however, proved a less perilous undertaking than they had anticipated. After the first night's fright, elephants troubled them not, the smaller beasts fled at their approach, and they took care not to give the alligators a chance of improving the occasion. Barring the tearing of their unprotected bodies by the thorns, they suffered little. Once, indeed, they narrowly escaped falling into the untender clutches of the savages haunting the forest. 'All along,' says Knox, 'as we went by the side of the river, had been the tents of the wild men, made only of boughs of trees; but, God be praised! they were all gone, though but very lately before we came, as we perceived by the bones of cattle and shells of fruits which lay scattered about. Once, about noon, sitting down upon a rock by the river-side to take a pipe of tobacco and rest ourselves, we had almost been discovered by the women of these wild people coming down to wash themselves in the river, who, being many of them, came talking and laughing together. At the first hearing of the noise, being at a good distance, we marvelled what it was: sitting still and listening, it came nearer, a little above where we sat; and at last we could plainly distinguish it to be the voices of women and children. Whereupon we thought it best to sit no longer, since we could escape undiscovered, and so took up our bags, and fled as fast as we could.'

In five days' time, the little party reached the river Coranda, which they forded, and immediately afterwards came upon two men boiling rice under a tree. A palaver with the fingers followed, ending in the Englishmen sitting down to dinner, and, dinner over, filling their hosts' pipes in payment. Knox contrived to make them understand that he wanted to go to Mynheer's territory; and one of them consented to act as guide upon receiving all the money of which the travellers were possessed—some five shillings or so. He shewed them the way for a mile, and then was about to make off, but, tempted with a knife and a red cap, he agreed to take them another mile, and bade them good-bye with the comforting assurance that they were safe from all danger of capture. Next day they met a man who understood Cingalese, and were rejoiced to learn that a walk of six miles would bring them to the Dutch fort of Arrepa; and there they arrived at four o'clock in the afternoon, on the 18th of October 1679; and in something less than a year, were once again in England; their captivity, according to Knox's calculation, having lasted nineteen years, six months, and some odd days.

## CHRISTMAS!

How brightly the sun shines up in the blue wintry sky, and how dazzlingly white the earth looks in her pure robe of snow! The church bells ring out merrily on the crisp air, and the holiday folk look bright and happy in their Sunday clothes and cheery smiles. For it is Christmas-day! And to many what does that word not mean? Enjoyment, comfort, and a good hot dinner for, at any rate, once in the long year. Christmas, to all children's ears, whether rich or poor, has a delightful, charmed sound. For weeks before the eventful day arrives, they think of it and talk of it, joyously anticipating all the wonders it will bring forth. For those that are rich, it acts the part of some kind fairy, who loves little children, and comes to them with lips warm with kisses, and what is better, arms full of beautiful gifts. Before they are awake, she comes softly into the room, and with her magic wand touches the chair or table by their bedsides, and lo! it blooms into a rich luxuriance of toys! Beautiful dolls, in wonderful flaxen tresses and superb toilets; elegant china tea-services, and chairs and tables for their use, and dainty *bonbon* boxes to prevent their starving before their new mistresses awake; giant Noah's arks, tops, puzzles, books, bags—all these and other wonders come to life by the enchanter's wand on Christmas morning. Perhaps, if the little folks woke earlier, they might be struck with the fairy's likeness to a familiar figure they have known and loved all their little lives; but they are young, and the young sleep so soundly.

To the poor man's child, Christmas is almost as wonderful. The poor child who rarely tastes meat, looks forward with perhaps greater pleasure to the hot beef and potatoes, than does the rich one to the turkey, plum-pudding, and mince-pies! Yes, Christmas is a never-ending delight to children; but as we grow older, we grow wiser and sadder, and somehow jovial Father Christmas seems to grow sadder too. For then the Past rises out of the darkness of oblivion, and lives once more, brightening us with its remembered joys, or

shadowing us with its sorrows. The very air we breathe seems full of memories; our minds, our homes, are filled with them. Sometimes they are bright and happy, and then we are bright and happy too; but often they are sad, and our eyes grow dim with quiet tears, and our hearts throb with forgotten pain. But for the children these things are not; they live in the present, joyous and unthinking. See how delighted they are! How they laugh and rejoice over their new toys, that the bright fairy brought them when they were asleep, and how they fling their little arms round their mother's neck, and kiss her with their rosy lips. She clasps them to her, and wishes them a merry Christmas, with a bright smile on her face; and they do not know that behind that smile she is thinking of another little figure with bright eyes, and warm arms and lips, who on former Christmas mornings used to kiss and thank her as they are doing now. They cannot tell that while they are eating their breakfast, chatting and disputing merrily, she had (in spirit) gone out through the cold into the little churchyard where her darling's grave lies pure and white under the soft winter snow, and glistens like diamonds in the sunshine. Then comes church; which, somehow, the children do not welcome quite so heartily as the other items of the day; but frequent mental peeps at the glorious dinner that is coming suffice to sustain them through the sermon (with its sweet old familiar story, which tells of the opening scenes of that most loving and beautiful of all lives), and when they come out into the sharp cold air, their spirits rise, and they run and skip merrily homewards through the pretty snow-clad meadows and lanes, where every block glistens with nature's gems, and every twig, and stalk, and leaf is a miracle of crystallised beauty. The crimson breast of robin shews like a splash of blood on the dazzling white hedge—he is going home to his dinner too, for he knows of a certain crumb-strewed window—and jerks his tail, and looks at the children with his bright black eyes, as they patter along, awaking the echoes of the air with their sweet treble voices, and snow-balling one

another till their cheeks and hands are as red as the robin.

The walk home is not so pretty for the town children—but they have the merry-making at the end of it just the same; for after that walk the real business of the day begins. Rat-tat-tat! Ring-ring-ting! go the knocker and the bell in a discordant duet; and soon the house is overflowing with uncles, aunts, and cousins. Every one is familiar with the dinner—in that there is usually not much variety—a fact which only serves to make it a better medium for memory. We take our places, and the warm room echoes with the hum of voices; we glance round at the many faces bent over the well-filled plates. The children's bright heads and flushed cheeks look so softly warm in the mellow lamplight, and the gray hair of their elders shines like silver. Those two round-faced, innocent-looking boys opposite, who have apparently laid a wager as to who shall eat the most in the shortest possible time, will certainly choke, even if they escape ruining their digestions. Feeling slightly nervous on their account, we turn away, and again look round at the sea of heads; and with a sudden pang we remember that one bright young face—that but a little while ago sat and laughed with the others—is missing now; for the angel of death came and stole the light from the loving eyes, and the colour from the rosy cheeks; and so missing her, our eyes grow dim with tears as they travel on to where another face is not—this time it is a sweet old face, with kind eyes and silver hair, that we have known and loved from childhood.

The charming thing about an English Christmas is, that it is the national festival for the renewal of early friendships. Relations rally round the head of the family. Petty differences are forgiven and forgotten. Good Christian feeling is demonstrated in a way perfectly unobjectionable. Those who, from necessity, are absent from the family circle are not forgotten. Some are married and gone; some, a son or brother perhaps, are away fighting life's battle far from home. Oh! how our hearts go out to them as we sit there. If our blessings have effect, how happy must they be! Could they but return to us for this one day, how happy we should be! Most likely that joy is in store for us, hidden away somewhere in the future. And we may be sure that they too are thinking kindly of us, and wishing they could be with us to help us to demolish the good cheer.

On Christmas-day the world's heart throbs in sympathetic unison from end to end; it enlarges and expands, and its sympathies are greater and reach farther than at other times. Even though it renews our sorrows and uncovers our sacred dead, yet it softens us, and deepens our feelings for others, and makes us more willing to be charitable to the poor. We like to know that they have their hot meat and even pudding for dinner, and we cannot bear to think of starving and homeless thousands, whom we know exist, and whom we are powerless to help. Then our thoughts take more frequent and longer flights than on other days—they traverse continents and oceans, carrying with them to our dear absent ones our love and our blessings—and they strive to pierce the thin, dark, mysterious veil which shuts us out from those other dear ones whom we have loved and lost. Human nature is vibrating with the

electricity of sympathy and love—and how can we tell that the vibration ceases here? Astronomers tell us that when a disturbance occurs among the electrical forces on the sun's surface, a corresponding disturbance takes place among those forces on the earth—causing auroras and magnetic storms.

May not the inhabitants of the spirit-world also feel, by sympathy, the vibration that is thrilling us here? Perhaps that day awakes memories in them, as it does in us! We look at the vacant places at the table through our tears, and feel sorrow in our hearts, and all the while the bright happy spirits of the dead we so loved may be there still—looking at us with sweet eyes, and radiant smiles that never fade—watching us—loving us—waiting for us—who knows? Only 'whilst this muddy vesture of decay doth grossly close us in, we cannot hear'—we cannot see them.

But all this time that we are growing so sad and puzzled with our thoughts, what a noise the children are making! how they laugh, how rosy their cheeks are, and how brightly their eyes shine in the yellow lamplight! Each cracker and each motto is greeted with fresh merriment—and as we look at them we envy them, and are inclined to wonder how they can be so happy and light-hearted. Ah, well! let them enjoy their young lives as long and as heartily as they can. They will not always be children—man is born to sorrow as the sparks fly upwards—and trouble may come soon enough. We were like them once, and revelled in our toys and our puddings and the mere wonderful fact of our existence, as keenly as they are doing—with never a thought of sorrow or weeping behind. And so at last, to the sound of laughter, and music, and dancing, the evening wears away. The pale moon shines up in the frosty star-spangled sky, making the earth seem a vast sea of white, as if she were some giant bird, and had lain down to rest. Once more the peaceful night closes us in, seeming to breathe over all nature as she comes with noiseless tread, threading her way through the golden stars. 'Peace on earth, goodwill to men!' and sleep comes gently to us, and blots out all our tired thoughts, and closes the children's laughing eyes, and hushes their merry voices, whilst the Night enfolds the tired earth more closely in her arms, and clasps it lovingly to her breast.

## THE FLAG OF DISTRESS.

### CHAPTER LIII.—THE TABLES NEARLY TURNED.

At the cliff's base, the action simultaneous, is yet more exciting. Having left their boat behind, with a man to take care of it, the rescuers advance towards the inner end of the cove. At first with caution, till, passing the rock-portal, they see the platform and those on it. Then the young officers rush forward, with no fear of having to fight. Instead of armed enemies to meet them, they behold the dear ones from whom they have been so long separated. Beside them, half-a-dozen figures, more like spectres than men—with cowed, craven faces, seeming so feeble as to have a difficulty in keeping their feet! With swords sheathed, and pistols returned to their holsters, they hasten on, the girls rushing out to receive them. Soon they are together, two and two, breasts touching, and arms enfolded in mutual embrace. For a while no

words—the hearts of all four too full for speech. Only ejaculations and kisses, with tears, not of sorrow. Soon follow speeches, necessarily brief and half-incoherent; Crozier telling Carmen that her father is still alive, and aboard the barque. He lives! he is safe! that is enough! Then, in answer to his questions, a word or two on her side; but without waiting to hear all, he turns abruptly upon Harry Blew, who is seen some paces off. Neither by word nor gesture has the sailor saluted him. He stands passive, a silent spectator; as Crozier supposes, the greatest criminal on earth.

In quick retrospect of what has occurred, and what he has heard from Don Gregorio, how could it be otherwise? But he will not condemn without hearing; and, stepping up to the ex-man-of-war's-man, he demands explanation of his conduct, sternly saying: 'Now, sir, I claim an account from you. Tell your story straight, and don't conceal aught, or prevaricate. If your treason be as black as I believe it, you deserve no mercy from me. And your only chance to obtain it, will be by telling the truth.'

While speaking, he draws his sword, and stands confronting the sailor, as if a word were to be the signal for thrusting him through.

Blew is himself armed, with both pistol and knife. But, instead of drawing or making any show of defence, he remains cowed-like, his head drooping down to his breast. He gives no response. His lips move not; neither his arms nor limbs. Alone, his broad chest heaves and falls, as if stirred by some terrible emotion. His silence seems a confession of guilt.

Taking, or mistaking, it for this, Crozier cries out: 'Traitor! Confess, before I run this blade through your miserable body!'

The threat elicits an answer. 'You may kill me, if you wish, Master Edward. By rights, my life belongs to ye. But, if you take it, I'll have the satisfaction o' knowin' I've done the best I could to prove my gratefulness for your once savin' it.'

Long before he has finished his strange speech, the impending stroke is stayed, and the raised blade dropped point downward. For, on the hand which grasps it, a gentler one is laid, a soft voice saying: 'Hold, Eduardo! What would you do? You know not. This brave man, to him I owe my life—I and Inez.'

'Yes,' adds Inez, advancing; 'more than life. 'Tis he who protected us.'

Crozier stands trembling, the sword almost shaken from his grasp. While sheathing it, he is told how near he has been to doing that which would ever after have made him miserable. He feels like one withheld from a crime—almost parricide. For, to have killed Harry Blew, would have been like killing his own father.

The exciting episode is almost instantly succeeded by another, still more stirring and longer sustained. While Carmen is proceeding to explain her interference on behalf of Blew, she is interrupted by cries, coming up from the beach. Not meaningless shouts, but words of ominous import: 'Ahoy, there! help! help!' Coupled with them, Crozier hears his own name, then the 'Help, help!' reiterated; recognising the voice of the man left in charge of the boat. Without hesitating an instant, he springs off toward the strand, Cadwallader and the gold-diggers following; two staying to keep

guard over those of the robbers who have surrendered. On clearing the rocky portal, they see what is causing the boat-keeper to sing out in such terrified accents—a sight which sends the scare through their own hearts, with cries of alarm from their lips. He in the boat is on his feet, with a boat-hook in his hands, which he brandishes in a threatening manner, shouting all the while. Four men are making towards him fast as their legs can carry them. They are coming along the strand from the right side of the cove. At a glance the young officers see who they are; at least two of them—De Lara and Calderon—sooner from their not meeting them unexpectedly. For aware that these are on the isle, they were about to go in quest of them, when summoned by the cries. No need to search for them now. There they are, with their confederates, rushing direct for the boat—already within pistol-shot of it! There can be no doubt as to their intent, and the certainty of it sends a cold shivering fear through the hearts of those who see them, all suddenly recognising a danger seeming as death itself. They remember having left only two or three men on the barque. Should the pirates succeed in boarding her, they may carry her off to sea, leaving the rescuers on the isle, and then—

An appalling prospect, they have no time to dwell on, nor need; for it comes before them like a flash in all its horrid details. Without waiting even to exchange word with one another, they rush on to arrest the threatened catastrophe, bounding over the rocks, crashing through shells and pebbles. But they are behind time, and the others will reach the boat before them! Crozier seeing this, shouts to the man: 'Shove off! Into deep water!'

The sailor, understanding what is meant, brings the boat-hook point downward, and with a desperate effort pushes the keel clear, sending the boat adrift. But before he can repeat the push, pistols are fired, and, simultaneous with their reports, he is seen to sink down, and lie doubled over the thwarts. A yell of vengeance peals from the pursuing party; and maddened, they rush on. They will be too late. Already the pirates have reached the boat, now undefended; and all four together, swarming over the gunwale, drop down upon the thwarts, each laying hold of an oar, and shipping it. In agony, Crozier cries out: 'Oh, they cannot surely get away—those guilty wretches?' But it would seem so. They have dropped their oar-blades in the water, and commenced pulling, while they are beyond pistol-range. Ha! something stays them! An avenging Power stays them. Their arms rise and fall, but the boat moves not! Her keel is on a coral bottom; her bilge caught upon its rough projections. Their own weight pressing down, holds her fast, and their oar-strokes are idly spent!

They had not thought of being thus stayed; which proves the turning-point of their fate. No use their leaping out now, to lighten the boat; no time for that, nor any chance to escape. But two alternatives stare them in the face—resistance, which means death, and surrender, that seems the same. De Lara would resist and die; so also Rocas. But the other two are against it, instinctively holding on to whatever hope of life may be left them.

The craven Calderon cuts short the uncertainty by rising erect, stretching forth his arms, and

crying out in a piteous appeal for mercy. In an instant after they are surrounded, the boat grasped by the gunwale, and dragged back to the shore. Crozier with difficulty restrains the angry gold-diggers from shooting them down on the thwarts. Well for them the boat-keeper was not killed, but only wounded, and in no danger of losing his life. Were it otherwise, theirs would be taken on the spot. Assured of his safety, his rescuers pull the four wretches out of the boat; then disarming, drag them up to the platform, and bestow them in the larger cave; for a time to be their prison, though not for long. There is a judge present, accustomed to sit upon short trials, and pass quick sentences, soon followed by execution. It is the celebrated Justice Lynch.

Represented by a stalwart digger—all the others acting as jury—the trial is speedily brought to a termination. For the four of Spanish nationality the verdict is guilty—the sentence, death on the scaffold. The others, less criminal, to be carried on to Panama, and there delivered over to the Chilean consul; the crime being mutiny, with robbery, and abandonment of a Chilean vessel. An exception is made in the case of Striker and Davis. The 'Sydney Ducks' receive conditional pardon, on promise of better behaviour throughout all future time. This they obtain by the intercession of Harry Blew, in accordance with the hint he gave them while they stood beside the spread tarpauling.

Of the four sentenced to be hanged, one meets his fate in a different manner. The gold-dust has been recovered, packed, and put into the boat. The ladies are cloaked, and impatient to be taken back to the barque, yearning to embrace him they so long believed dead. The young officers stand beside them; all awaiting the last scene of the tragedy—the execution of the condemned criminals. The stage has been set for it; this the level plot of ground in front of the cavern's mouth. A rope hangs down with a running noose at one end; the other, in default of gallows arm and branch of tree, rigged over the point of a projecting rock. All this arranged, De Lara is led out first, a digger on each side of him. He is not tied, nor confined in any way. They have no fear of his making escape. Nor has he any thought of attempting it; though he thinks of something else, as desperate and more deadly. He will not die like a scared dog, but as a fierce tiger, to the last thirsting for blood, to the end trying to destroy—to kill! The oath sworn to Calderon on the cliff, he is still determined on keeping. As they conduct him out of the cave, his eyes, glaring with lurid light, go searching everywhere, till they rest upon a group some twenty paces distant. It is composed of four persons: Crozier and Carmen Montijo, Cadwallader and Inez Alvarez, standing two and two. At the last pair De Lara looks not, the first enchainning his attention. Only one short glance he gives them; another to a pistol which hangs holstered on the hip of a gold-digger guarding him. A spring, and he has possession of it; a bound, and he is off from between the two men, rushing on the group standing apart.

Fortunately for Edward Crozier—for Carmen Montijo as well—there are cries of alarm, shouts of warning, that reach him in time. He turns on hearing them, sees the approaching danger, and takes measures to avert it. Simple enough these

—but the drawing of his revolver, and firing at the man who advances.

Two shots are heard, one on each side, almost simultaneous; but enough apart to decide which of the two who fired must fall. Crozier's pistol has cracked first; and as the smoke of both swirls up, the gambler is seen stretch upon the sward, blood spurting from his breast, and spreading over his shirt bosom!

Harry Blew, rushing forward, and bending over him, cries out: 'Dead! Shot through the heart—brave heart too! What a pity 'twas so black!'

'Come away, *mia!*' says Crozier to Carmen. 'Your father will be suffering from anxiety. You've had enough of the horrible. Let us hope this will be the end of it.'

Taking his betrothed by the hand, he leads her down to the boat—Cadwallader with Inez accompanying them.

All seat themselves in the stern-sheets, and wait for the diggers; who soon after appear, conducting their prisoners—the pirate crew of the *Condor*—short four left behind, a banquet for the vultures and sea-birds.

#### CHAPTER LIV.—A SAILOR'S TRUE YARN.

It is the second day after the tragic scene upon the isle, and the Chilean barque has sailed away from the Veraguan coast, out of that indentation known upon modern maps as 'Montijo Bay.' She has long since rounded Cabo Mala, and is standing in for the port of Panama. With a full crew—most of them old and able seamen—no fear but she will reach it now. Crozier in command, has restored Harry Blew to his situation of first-officer; which, so far from having forfeited, he is deemed to doubly deserve. But still weak from his long privation, the ex-man-o'-war's man is excused from duty, Cadwallader doing it for him. Harry is strong enough, however, to tell the young officers what they are all ears to hear—the story of that *Flag of Distress*. Their time hitherto taken up attending upon their fiancées, they have deferred calling for the full account, which only the English sailor can give them. Now having passed Cabo Mala, as if with the 'wicked cape' all evil were left behind, they are in the mood to listen to the strange narration in all its details; and summon the chief-officer to their side.

'Your honours!' he begins, 'it's a twisted-up yarn, from the start to the hour ye hove in sight; an' if ye hadn't shewed yerselves just in the nick o' time, an' ta'en the twist out o' it, hard to say how 'twould a ended. No doubt, in all o' us dyin' on that desert island, an' layin' our bones there. Thank the Lord, for our delivery—without any disparagement to what's been done by both o' you, young gentlemen. For that He must ha' sent you; an' has had a guidin' hand throughout the whole thing, I can't help thinkin', when I look back on the scores o' chances that seemed goin' against the right, an' still sheered round to it after all.'

'True,' assents Crozier, honouring the devout faith of the sailor. 'You're quite right in ascribing it to Divine interference. Certainly, God's hand seems to have been extended in our favour. But go on!'

'Well, to commence at the beginnin', which is when you left me in San Francisco. As I told Master Willie that day he come ashore in the

dingy, I war engaged to go chief-mate in the Chili barque. She war then a ship; afterward converted into a barque as ye see, through our shortness o' hands. When I went aboard her, an' for several days after, I war the only thing in the shape o' sailor she'd got. Then her captain—that poor crazed creetur below—put advertisements in the papers, offering big pay; the which, as I then supposed, brought eleven chaps, callin' themselves sailors, an' shippin' as such. One o' 'em, for want o' a better, war made second-mate—his name bein' entered on the books as Padilla. He war the last o' the three swung up, an' if ever man deserved hangin', he did, bein' the cruellest scoundrel o' the lot. After we'd waited another day or two, an' no more makin' appearance, the skipper made up his mind to sail. Then the old gentleman, along wi' the two saynoreetas, came aboard; when we cleared an' stood out to sea. Afore leavin' port, I had a suspishun about the sort o' crew we'd shipped. Soon's we war fairly afloat, it got to be somethin' worse than suspishun; I war sartin then we'd an ugly lot to deal with. Still, I only believed them to be bad men—an', if that war possible, worse seamen. I expected trouble wi' them in sailin' the vessel; an' a likelihood o' them bein' disobedient. But on the second night after leavin' land, I found out somethin' o' a still darker stripe—that they war neither more nor less than a gang o' piratical conspirators, an' had a plan already laid out. A lucky chance led to me discoverin' their infarnal design. The two we've agreed to let go, Striker an' Bill Davis—both old birds from the convict gangs o' Australia—war talkin' it over atween themselves, an' I chanced to overhear them. What they sayed made everythin' clear—as it did my hair to stand on end. 'Twar a scheme to plunder the ship o' the gold-dust Don Gregorio hed got in her; an' carry off your young ladies. Same time they war to scuttle the vessel, an' sink her; first knockin' the old gentleman on the head, or drownin' of him as well as the skipper. Your humble sarvint an' the darkey war to be disposed o' same sweet fashion. On listenin' to the dyabolikal plot, I war clear dumfounded, an' for a while didn't know what to do. 'Twar a case o' life an' death to some o' us; an' for the saynoreetas, somethin' worse. At first, I thort o' tellin' Captain Lantanas, an' also Don Gregorio. But then I seed if I shud, that't would only make death surer to all as were doomed. I knowed the skipper to be a man o' innocent, unsuspishus nature, an' mightn't gie belief to such 'trocious rascality, as bein' a thing possible. More like he'd let out right away, an' bring on the bloody bizness sooner than they intended it. From what Striker an' Davis said, I made out, that it war to be kept back till we should sight land near Panama. After a big spell o' thinkin', I seed a sort o' way out of it—the only one appearin' possible. 'Twar this: to purtend joinin' in wi' the conspirators, an' put myself at thar head. I'd larnt from the talk o' the two Sydney Ducks, there war a split 'mong them, 'bout the dividin' o' the gold-dust. I seed this would gie me a chance to go in along wi' them. Takin' advantage o' it, I broached the bizness to Striker that same night, an' got into thar councils; afterwards obtainin' the influence I wanted. Mind ye, gentlemen, it took a smart show o' trickery an'

maneuvin'. Among other things, I had to appear cool to the cabin people throughout all the voyage—specially them two sweet creeturs. Many's the time my heart ached a-thinkin' o' yourself, sir, as also o' Master Willie—an' then o' your sweet-hearts, an' what might happen, if I shed fail in my plan for protectin' 'em. When they wanted to be free an' friendly, an' once began talkin' to me, I hed to answer 'em gruff an' growlin' like, knowin' that eyes war on me all the while, an' ears a-listenin'. As to tellin' them what was before, or givin' them the slimmiest hint o' it, that would a spoilt my plans. They'd a gone straight to the old gentleman, an' then it would a been all up wi' us. 'Twar clear to me they all couldn't then be saved, an' that Don Gregorio himself would hev to be sacrificed, as well as the skipper an' cook. I thought that dreadful hard; but thar war no help for't, as I'd have enough on my hands in takin' care o' the women, without thinkin' o' the men. As the Lord has allowed, an' thank Him for it, all have been saved!

The speaker pauses in the fervour of his gratitude, which his listeners respecting, in silence wait for him to continue. He does so, saying: 'At last, on sightin' land, as agreed on, the day had come for the doin' o' their dark deed. It war after night when they set about it, myself actin' as a sort o' recognised leader. I'd played my part so's to get control o' the rest. We first lowered a boat, puttin' our things into her. Then we separated, some to get out the gold-dust, others to seize the saynoreetas. I let Gomez look after them, for fear of bringin' on trouble too soon. Me an' Davis—who chanced to be a sort o' ship's carpenter—were to do the scuttlin'; an', for that purpose, went down into the hold. There, I proposed to him to give the doomed ones a chance for their lives, by lettin' the *Condor* float a bit longer. Though he be a convict, he warn't nigh so bad as the rest. He consented to my proposal, an' we returned on deck 'ithout tappin' the barque's bottom timbers. Soon's I had my head over the hatch combin', I seed them all below in the boat, the girls along wi' them. I didn't know what they'd done to the Don an' skipper. I had my fears about 'em, thinkin' they might ha' been murdered, as Padilla had proposed. But I daren't go down to the cabin then, lest they might shove off, an' leave us in the lurch; as some war threatenin' to do, more than one wantin' it, I know. If they'd done that—well, it's no use sayin' what might ha' been the upshot. I seed 'twould a knocked all my plans on the head; an' tharfor, hurried down into the boat. Then, we rowed right away; leavin' the barque just as she'd been the whole o' that day. As we pulled shoreward, we could see her standin' off, all sails set—same as tho' the crew war aboard o' her workin' 'em.'

'But her ensign reversed?' asks Cadwallader. 'She was carrying it so, when we came across her. How came that, Harry?'

'Ah! the bit o' buntin' upside down! I did that overnight myself in the dark; thinkin' it might get them a better chance o' bein' picked up.'

'And you did the very thing!' exclaims Crozier. 'I see the hand of Providence in that, surely! But for the distress signal, the *Crusader* would have kept on without giving chase; and—'

But, proceed! Tell us what happened afterwards.'

'Well; we landed in the island, not knowin' it to be a island. An' theer's another o' the chances, shewin' we've been took care o' by the little cherub as sits up aloft. If 't had been the mainland—well, I needn't tell ye, things would now be different. Arter landin', we stayed all night on the shore; the men sleeping in the biggest o' the caves, while the ladies occupied a smaller one. I took care 'bout that separation myself, detarmined they shouldn't come to no harm, that night. There war a thing happened which I daresay they've told you; an' 'twar from them I afterwards larned that Gomez an' Hernandez war no other than the two chaps you'd trouble wi' at San Francisco. They went into the cave, an' said some insultin' things to the saynoreetas; but I warn't far off, an' would a made short work wi' them, hed it goed further than talk. Up at a early hour next mornin', we found the boat hed drifted off seaward, an' got bilged on the breakers. But supposin' we shouldn't want her any more, nobody thought anythin' about it. Then comed the dividin' o' the gold-dust, an' after it the great questyun—leastwise, so far as I war consarned—as to who should take away the girls. I'd been waitin' for this, an' now for the settlin' o't I war ready to do or die. Gomez an' Hernandez war the two who laid claim to 'em—as I knowed, an' expected they would. Pretendin' a likin' for Miss Carmen myself, an' puttin' Davis up to what I wanted, we too made our claim. It ended in Gomez an' me goin' in for a fight; which must a tarminated in the death o' one or other o' us. I hed no dread o' dyin'; only from the fear o' its leavin' the poor creeturs unprotected. But thar war no help for 't, an' I agreed to the duel; which war to be fought first wi' pistols, an' finished up, if need be, wi' the steel. Everythin' settled, we war 'bout settin' to, when one o' the fellows—who'd gone up the cliff to take a look ahead—just then sung out, that we'd landed on a island. Recallin' the lost boat, we knew that meant a dreadful danger. In coorse it stopped the fight, an' we all rushed up to the cliff. When we saw how things stood, there war no more talk o' quarrellin'. The piratical scoundrels war scared nigh out o' thar senses; an' would a been glad to get back aboard the craft they'd come out o', the which all, 'ceptin' Davis an' myself, supposed to be at the bottom o' the sea. After that, 'twar all safe, as far as consarned the saynoreetas. To them as would ha' took 'em, they war but a second thought, in the face o' starvation; which soon tamed the wolves down, an' kep 'em so till the last o' the chapter. Now, gentlemen; ye know how Harry Blew hav behaved, an' can judge for yourselves, whether he's kep the word he gied you 'fore leavin' San Francisco.'

'Behaved nobly, grandly!' cries Crozier. 'Kept your word like a man: like a true British sailor! Come to my arms—to my heart, Harry! And forgive the suspicions we had, not being able to help them. Here, Cad! Take him to yours; and shew him how grateful we both are to the man who has done more for us than saving our lives.'

'Bless you, Blew! God bless you!' exclaims Cadwallader, promptly responding to the appeal; and holding Harry in a hug that threatens to strangle him.

The affecting scene is followed by an interval

of profound silence; broken by the voice of Grummet, who, at the wheel, is steering straight into the port of Panama, now in sight.

'Mr Crozier!' calls out the old coxswain, 'ye see that craft, sir—the one riding at anchor, out yonder in the roadstead?'

All turn their eyes in the direction indicated; soon as they have done so, together exclaiming: 'The Crusader!'

The last scene of our story occurs at Cadiz, in a grand cathedral church. Before its altar stand two English naval officers, alongside each a beautiful Spanish damsel, soon to be his wedded wife. It scarce needs to tell, that the bridegrooms are Edward Crozier and Willie Cadwallader. Nor need it be told who are the brides; since they are to be given away by Don Gregorio Montijo. Nor is it necessary to describe the ceremonial splendour of that double wedding—for long time the great topic of Cadiz. Enough to say, that present at it are all the wealth and fashion of the old Andalusian city, with foreign consuls, and the commanders of war-ships in the port; conspicuous amongst these, Captain Bracebridge, and the officers of H.B.M. frigate *Crusader*. Also two other men of the sea—of its merchant service; to hear of whose presence there, will no doubt make the reader happy, as it does both brides and bridegrooms to see them. They belong to a ship lying in the harbour, carrying polacca masts, on her stern lettered *El Condor*; one of the two being her captain, called Lantanas; the other her chief-officer, by name Blew. The good fates have been just and kind to the gentle Chilian skipper, having long since lifted from his mind the cloud that temporarily obscured it. He now knows all, above all, Harry Blew in his true colours; and, though on the *Condor's* deck they are still captain and mate, when below by themselves in her cabin, all distinction of rank disappears, and they are affectionate friends—almost as brothers. In the prosperous trading-craft, *Condor*—reconverted into her original ship-rig—regularly voyaging between Valparaiso and Cadiz—exchanging the gold and silver of Chili for the silks and sweet wines of Spain—but few recognise a barque once chased over the South Seas, believed to be a spectre; and, it is to be hoped, no one will ever again see her sailing under a FLAG OF DISTRESS.

THE END.

#### CRAGSMEN AND THEIR PERILS.

THOSE who risk their lives by clambering up and down precipitous cliffs are, so far as public appreciation goes, generally to be met with in alpine countries, where walls of rock two or three thousand feet high are to be encountered. Readers are never tired of narratives of their adventures, if told with graphic effect. There are three classes of such adventurers. In the first class are the men of science, who, in the laudable pursuit of knowledge, risk their lives in the ascertainment of facts bearing upon botany, ornithology, astronomy, geology, climatology, the formation and movements of glaciers, &c. All honour to the Humboldts and Bonplands, the Saussures and Deluc, the Forbeses and Tyndalls. In the second class may be placed those who clamber up and down for the glory of the thing, to excel (and perhaps to crow over) their

stay-at-home friends. These are the tourists who 'do' Mont Blanc, Monte Rosa, the Matterhorn, the Oertler Spitze, and other break-neck mountains. Of course, we hope that they, especially the lady-tourists, will not break their necks; but still such adventures, though involving a certain amount of endurance and not a little excitement, deserve only secondary commendation, when no scientific discoveries result therefrom. The real cragsmen, who may be grouped by themselves, are the hunters, whose lives are imperilled in the search for their daily bread. True, the chamois-hunter and the hunters of other mountain animals do not reach such wonderful ledges and jutting rocks as do the animals themselves; nevertheless, they climb to very perilous spots to get a shot at their quarry, and to pick it up when shot.

There is another kind of cragsmen or cliffmen, however, much less frequently talked of and written about; namely, those who capture wild-fowl on the precipitous cliffs of rugged coasts. We know comparatively little concerning them, because travellers and tourists seldom find their way to the scenes of their dangerous calling, almost always desolate and inhospitable, though sublime in natural features.

This word 'fowl' is rather a puzzling one. What is a fowl? Some will give an answer by enumerating the varieties of Dorking, Bantam, Cochín-China, Sumatra, Jungle, Polish, Spanish, Frizzled, Fork-tailed, &c. Some, knowing that many kinds of fowl patronise the lake and the pond rather than the field and yard, feel that the answer must make some mention of Swans, Wild Ducks, Widgeon, Dunbirds, Teal, Sheldrakes, Coots, Curlews, Snipes, Lapwings, and other feathered bipeds so well known to the fowler of fen countries. But besides these two groups, there is one comprising those sea-birds or cliff-birds which shun the haunts of man and his belongings. These consist chiefly of Gannets, Guillemots, Razor-bills, and Puffins. Living mostly on fish, they roost near where fish can be caught; and no home pleases them better than the shaggy precipitous wall of a sea-cliff, which is sure to present numerous holes and corners, nooks and shelves, where the birds can nestle. As the flesh of the young birds is eatable, though of a fishy flavour, and as the feathers, down, and oil can always find a market, the birds are of considerable commercial importance. But what a life of peril is their capture, what a hard way of earning one's daily bread!

George and Peter Anderson describe the work of the sea-bird catchers at Handa, an island off the north-west coast of Scotland, opposite Scourie. On the seaward side of that small island is a cliff two miles long by six or seven hundred feet in height, almost perpendicular, and so smooth as to offer few facilities for foot-hold. There are here and there indentations and detached columnar masses, which are known alike to the birds and to their pursuers. On the narrow horizontal ledges of the cliffs, thousands of gannets, razor-bills, puffins, guillemots, and other sea-fowl, sit as closely together as they can be wedged, while thousands of others are on the wing during the breeding season—which is the best time for the fowler. A shot fired sets inconceivable numbers of birds on the wing. \* But some, either through natural stubbornness or from some other cause, stick to their roosting-places with the utmost pertinacity; stones and even shots failing to dislodge them. It is a common thing

for the daring fowlers, after much climbing up and down, to enter crevices into which we could hardly imagine men venturing, to take the birds by hand, or collect the large richly tinted, spotted eggs. Where the face of the cliff is too precipitous to permit even a cragsman to do this, he is let down by a rope from above, to a spot where he can capture his prey with a noose, or a hook, fastened to a short stick; sometimes the catch is very abundant in a short space of time. Whether the fowler heaves the killed birds to a boat stationed at the base of the cliff, or ties them round his waist, or signals to have them drawn up by a line to which many are strung at once, depends on the conformation of the cliff at each particular spot. The nesting season usually lasts from the middle of May to the middle of August; and it is only at such time that the sea-birds congregate there in any considerable number. Desolate Handa has few visitors except the fowlers. Once a ship was wrecked on the coast, and the yards tilted over so close to the face of the cliff as to enable some of the hapless seamen to clamber upon ledges and into recesses. How long they remained there, we are not told; but fortunately some fowlers, or it may be some fishermen, attracted to the spot by seeing the wreck of the vessel, espied the poor fellows, and rescued them while a little life still remained.

More wild, more perilous, more exciting even than that of Handa, is the sea-fowling at St Kilda. Indeed, an ordinary landsman can with difficulty conceive how the work can be carried on. St Kilda is a lonely island, eighty miles out westward beyond Lewis and Harris, two of the Hebrides. Strangers seldom approach the small island—it is only three miles long by two in breadth—except by an occasional steamer or a government cutter; but fishermen from Harris occasionally venture thither in open boats. There is only one landing-place, and this very difficult of access; all the rest of the coast is a rugged cliff from eight hundred to a thousand or more feet in height. A few inhabitants pick up a living on the island, partly by cultivating small patches of poor land, partly by fowling during the summer months. A fowling-party generally consists of four persons. Each party has at least one rope, about two hundred feet long, three-ply, and of strong raw cowhide prepared for the purpose; it is covered with dressed sheepskin to save it from chafing against the edges of the rock. A well-made rope of this kind is highly valued, and is even bequeathed by the owner to his successor, or given as a dowry with his daughter. A fowler descends the face of the cliff, suspended by the rope, which is held from above by two or three men. Armed with a staff or pole, to one end of which is fastened a piece of hair-line, he proceeds to search for birds. The hair-line is formed into a running noose, which he throws over the head of any bird sufficiently near; and by pulling it towards him the noose tightens upon the bird's neck, and secures its capture. Sometimes, linked together in couples, each with the rope fastened round his body, the fowlers clamber along the face of the cliff. When one is moving, the other plants himself on a ledge or shelf, obtains a firm foot-hold, and holds himself in readiness for exigencies; if his companion slips or stumbles, unflinching steadiness and a strong rope can alone avert disaster.

When the first man has arrived at a safe landing-ledge, he maintains a firm hold while the second follows. Some authorities state that one single man on the top of the cliff holds and manages the rope by which the fowler is suspended; but others assert—and we think with more probability—that two or more are generally employed.

The coasts of Norway, which are in some places more rugged, and grander in scale, than any of those in Scotland or the Hebrides, exhibit the characteristics of cliff-fowling with remarkable completeness. Mr Lloyd, who knew Norway better than almost any other Englishman, gives a graphic account of the system there pursued, in his *Scandinavian Adventures*. On some of the magnificent cliffs, two modes of getting at the birds and their nests are adopted—from the sea beneath, if the height to be climbed is not too great; from the edge of the cliff above, in other cases. When the men see their work fairly before them, as viewed from below, they approach the foot of the cliff in a boat. A pole, twenty or twenty-four feet long, has an iron hook at one end. This hook is looped into the strong waistband of the fowler's dress, and he is lifted or pushed up by men in the boat, or from any ledge of rock flat enough to sustain them; the lifting is something like that adopted by a butcher when he hooks up a leg of mutton in front of his shop; but the fowler aids his own ascent, partly by his hands, partly by a bird-pole which he carries with him. When he is safely lodged on any shaft or ledge of projecting rock that may afford foot-hold, a companion is hoisted up in a similar way. The two men then tie the rope to their bodies, the length of rope depending on the probable work required of it. One begins to climb up as high as he can, being pushed up by the flattened end of the pole held by his companion. When the uppermost man has reached a ledge that affords him anything like standing-room, however narrow and precarious, he pulls up the other by means of the rope. And so they proceed: No. 2 pushing up No. 1, and then No. 1 pulling or drawing up No. 2. The bird-pole having a hook at one end and a flattish top at the other, is invaluable on these occasions. When the two men reach a height at which the birds can be met with, one plants himself as firmly as possible on a ledge, to act as a stay or check; while the other gropes with hands and hook to capture the birds. If the latter slips, the former holds him up by the sheer resistance of the rope which binds the two together. Alas for both of them, if there be any weakness of muscle or of nerve at this moment!

The birds, not expecting to be disturbed so high up the face of the cliff, are comparatively tame, and are captured without resistance; a knock on the head seals their fate, prior to being heaved out into the sea and picked up by the attendant boat. To avoid being struck by a falling bird requires very great caution on the part of the boatmen, who accordingly give the rock a pretty wide berth, until the cragsmen, ceasing their labours for a while, permit the floating birds to be gathered. The velocity of a falling, full-fledged gannet would suffice to stave the stoutest open boat. If the weather be fine, the fowlers will remain several days and nights together aloft, when they can find ledges broad enough to sleep on, or recesses into which they can creep; food and other necessaries can be hauled

up by them from below—a hard way of earning a living, truly. In bygone times there was a law in Norway, strikingly illustrative of the dangers of this employment. When a fowler was killed by falling from the scarp of these terrible cliffs, his nearest relative was required to attempt the same adventure; if he succeeded, Christian burial was allowed to the body of the deceased; but if he could not or would not make the attempt, it was concluded that the death had been caused by recklessness, or want of judgment; the deceased was declared to have been the cause of his own death, and his corpse was awarded the un-Christian interment of a suicide. This strange law has not been acted upon in recent times.

Where the cliff is too high to be reached from the water, the fearless cragsmen of Norway commence their operations from above. A strong rope or rock-line, five or six hundred feet long, and two or even three inches in thickness, is fastened at one end round the waist of a fowler, and then passed between his legs in such a way that he can sit upon it. Six men at the top hold the rope, and 'pay it out,' lowering it by degrees; a smooth piece of wood being placed at the edge of the precipice, to shield the rope from chafing against rock. A smaller rope, also coiled round the fowler's waist, enables him to transmit such signals as 'higher,' 'lower,' 'right,' 'left,' 'stop,' &c. In constant peril from loose pieces of rock striking him in their fall, his chief defence is a thickly-lined fur cap to protect the head; his body and limbs defending themselves as best they may. The bird-pole is dexterously wielded. By thrusting the end of the pole against the vertical face of the rock, the cragsman can spring out to a considerable distance, and approach the cliff again at a different spot; he can do this even by the pressure of his feet alone against the rock, if his bound is to be of smaller range. This springing out and in again is much adopted where recesses occur beneath jutting portions of rock; the birds like to nestle in such spots, and the fowler gets a good haul each time his spring brings him to a fresh place. In some situations, where the recess is large enough, he loosens himself from the rope, which he temporarily fastens to a stone, and, moving about more easily, captures the birds with both hands; these he ties together with a small line, and signals to have them drawn up. Again he fastens himself to the rope, when his harvest at that spot has been gathered. Thus he will pass several hours of the day, until fatigue or appetite impels him to signal to be hauled up. If he be not firm and steady, and if the rope by which he is attached rotates, his chance becomes very precarious. An old Norwegian pastor said that these fowlers 'often expose themselves to the most imminent danger, merely to get a subsistence for their poor families, trusting in God's mercy and protection; to which the greater part of them seriously recommend themselves before they undertake the perilous work.'

It is evident, from the above details, that where the face of the cliff is exceptionally lofty and scarped, the co-operation of several men is necessary. If the suspension rope is really three inches thick, as Lloyd states, a cable of it five or six hundred feet in length must be very heavy; but we surmise that a thickness of two inches or thereabouts is more probable. Six men at

the top of the cliff will scarcely be needed to hold it at one time; more probably they work by relays. Where the operations are not of so formidable a character, one man will sometimes make the descent unaided; he fastens the rope round a post at the top of the cliff, lowers himself by it to a small depth, and, when he has caught a bird or two, hauls himself up again hand over hand. Be it done how it may, the daring exhibited is almost inconceivable to inland folk; for a ledge that can only be grasped by the fingers, and is wide enough only for half the length of the foot, will be made available as holding-ground by the fowler. Where the circumstances are favourable, ropes of moderate length are firmly fastened to jutting pieces of rock, and allowed to hang down at full length, ready to assist the fowlers at any time during the season, and removed when winter is coming on. There is a code of honour among these men: nothing belonging to one is used or removed by another without the owner's consent; there is a community of feeling among those who incur a common danger.

At the Bass Rock, a lonely islet in the Firth of Forth, where hundreds of young gannets or solan geese are annually taken, one man sometimes suffices to lower away the cragsman and attend to his signals. The number of young gannets taken in a season ranges from eight hundred to fourteen or fifteen hundred, according as the weather permits: these are stripped of their down, and either baked for eating, or boiled down for oil. This isolated rock is uninhabited save by sea-fowl, and in squally weather is exceedingly difficult to land upon, so that the 'keeper' or lessee, who dwells on the mainland two miles off, is entirely dependent upon moderately good weather for his season's take. This season (1875) has been a poor one, many of the young gannets having become fledged—and flown—before the weather would permit of cliff-operations. And here we may take the opportunity of informing our readers that the stock of solan geese on the Bass is now much smaller than it formerly was, the number of mature birds being estimated—though *myriads* are spoken of—at not more than twelve to fourteen thousand.

## THE CLYTIE.

### CHAPTER I.

NEAR an open window, overlooking the Square, sat Marian Elton writing a letter, as an Italian boy came by hawking some plaster images. The morning was so lovely that she felt the influence of its brightness with a warm glow of heart-gladdness which sunlight upon flowers has the power of imparting; and just then the dancing rays shone so beamingly upon the flower-box on the window-ledge, that she looked up to watch the dazzling effect, and inhale the perfume which the fragrant blossoms, as it seemed to her, exhaled gratefully.

The Italian boy, catching her eye as she thus paused, looked entreatingly, and begged her to buy one of his images. A glance at his woe-begone face touched her heart. 'Perhaps he is hungry,' she thought; and she beckoned him to call, while she rang the bell to have him admitted—not that she wanted any of his wares, but she felt some compunction in suffering a fellow-creature who

looked hungry to leave her door unopened, or without the means of procuring food. There were many very well designed images in his basket; but as her object was to relieve him, she took the first that offered—a miniature bust of Clytie. For the little image she paid him the price he asked, which was double its real worth. She knew he was cheating her, but she was one of those who could make allowance for the temptations of grim poverty, which finds honesty an almost impossible virtue when running a race with want.

On coming back to the room, she placed the Clytie on an empty bracket, and continued her writing; while every now and then she paused to take a glance at her purchase, with a feeling of compassion, as she recalled the mythological legend, and thought it but symbolised a fact of common occurrence. She regarded the Clytie (the water-nymph, whose love for the sun-god Apollo being unreturned, she was changed into a sun-flower, that she might ever follow his course) as the ideal of unrequited but constant affection—the unhappiest of woes for a woman to bear; so it seemed to her just then, and a shadow fell upon her spirits in the contemplation. 'Would her purchase prove an omen?' was a question which kept tormenting her mind, as she wrote to her friend the following:

'I have just bought a Clytie. O Amy, suppose I also love in vain! I feel that, like her, I too would for evermore turn, spell-bound, towards the sun of my world. It is appalling to think how utterly my heart has gone from me; and I have no sure hope that I shall ever find it where alone I care to keep it.

'We met again last night, when his coldness amounted to repulsion, but a repulsion which attracts me more than all the compliments I receive from the many who seem to court me. My life is now but weariness, unspent in his society. I live but in the hours when I know he is by; although, oddly enough, while full of conversation with those around, he rarely ever addresses me.

'And yet—and yet—*intuition!* I am mad to use the word; it is, after all, but a delusion of my overwrought brain, which imagines what it longs for. Forgive me, Amy; but I know that with you my feelings will be held sacred; and as it eases my overfull heart to pour them out to one so sympathetic and *safe*, you will not deny me the luxury my friendship calls thus largely upon your good-nature to honour, knowing, as I do, that your love is equal to any demands of mine on that score.

'It seems little else than a fatality which has overtaken me! You know, I may speak thus to you without vanity—that I have never lacked for that chivalrous attention which is gratifying to most girls. I have accepted it with appreciation, but nothing more; my heart, throughout, has remained intact; until, or even *before* he came. It is so strange; my interest awoke from the moment my cousin Harry's wife said to me one day, about a year ago: "We expect a visitor; an old friend of Harry's; they were at college together. I have heard so much of him, that I am quite curious to see this Mr Leonard Faithfull. Charming name, is it not?"

'I *felt* it so, and recalled what Balzac says in other words, "Who shall account for the attraction

of a name?" Laugh at me, Amy; I deserve it, for these confessions of mine are those of a girl who is but too alive to her foolishness!

"Yes, I conjured up visions of the man; visions which were more than realised when I met him for the first time at the Nugents, and he took me into dinner. I can only describe him to you as he then impressed me. A tall, fair, Saxon type of man on a grand scale; with light hair and beard, who spoke little, and was perfectly self-contained. Imagine my being attracted by such an opposite! but so it was.

"His remarks were few, and I was tongue-tied; so much so, that Harry said to me across the table: "Marian, why are you so silent? You are usually lively enough.—I hope, Faithfull, you have not overpowered my little cousin."

"He turned quietly towards me, and smiled, saying: "I should regret such a catastrophe for you, Miss Elton. I hope I am not so formidable as all that."

"I stammered out some senseless reply not at all to the purpose; but we advanced to a better understanding after that, for he began telling me of his travels, and I am sure that I rivalled Desdemona in the interest with which I listened. How I regretted the move to the drawing-room, which obliges ladies to yawn together for half an hour in each other's company! As I sat meditating after dinner, in a corner by myself, I could not help exclaiming, mentally: "You poor, foolish Marian! the serpent has got at last into your happy Eden of girlhood, and stolen away your peace for ever!"

"It is awful to awake to the truth of the situation; and how was I to hide it?—I, who am afflicted with a temperament that cannot bear the burden of a secret. I was ready to cry with vexation, to find that my independence of mind and will had so utterly gone from me; and yet, across my tears there gleamed a flash of such glorious electric sunlight, that I was nearly blind with joy when I realised for an instant the bare possibility of my ever winning the love of such a man! And then—transcendent folly!—I began to catalogue my qualities silently. What had I to attract one who, to my mind, was so far above me? At that moment, Amy, dear, I felt that I was the plainest, most commonplace woman in existence! and—will you believe the human heart is capable of such base intricacies?—began to look jealously upon every pretty woman in the room, who possessed in this respect chances so much greater than my own!

"If you do not think that I am a fit subject for the Commissioners in Lunacy to take note of after this confession, your forbearance reaches even unto the ideal of friendship, so rarely to be met with in this terrestrial sphere of perpetual disappointments.

"I was surrounded shortly after the gentlemen came into the room, and could scarcely disguise the boredom I felt, until that most pertinacious of men, William Blakeney, who vows he will never take my "No" for an answer, worried me to death by asking me why I was out of spirits—was it the weather, &c.—until I became so irritated that I rose from my seat and left him.

"To my dismay, as I was crossing the room, I found Mr Faithfull's eyes intently fixed on me, as if he had been watching my proceedings, and was striving to read my character. He turned away as soon as he saw I noticed him, but throughout the

evening I observed him bent on the same study, until I became so conscious and embarrassed I did not know what to do; for the odd part of it was, he never once spoke to me. He only flung about me a chain of fascination, from which I found it impossible to escape.

"He remained with the Nugents for a time, and then removed to his club, I imagine. I saw him frequently. He never sought, and he never avoided me; while I—and this, Amy, is my shame and torment—could not hide from him how much I felt. He must have seen it in my face each time we met. How I have detested—how I abhor myself when I remember that it is I who am the wooer, and he just suffers my attentions! Our positions are entirely reversed; and the worst of it is, I can no more help its being so than the poor little needle, or the miserable steel-filing, can help being attracted by the magnet. He visits at our house, is liked by my family, I, each day, growing more and more feverish and impatient for some sign of preference, which, alas! he never gives. Polite he always is, but as cold as death; while I, poor lost soul that I am, have grown more hopelessly infatuated than ever, until I fear I am fast becoming a monomaniac.

"This, dear Amy, is my miserable story, which I have been wishing some time to confide to you. Clytie looks mournfully at me, as though she said: "I, too, suffered as you do; they suffer most whose natures are strongest to love most, for they are faithful even unto death." Is his name to be woven *thus* into my life? God forbid! And yet, unmaidenly as the speech may sound to other ears than yours, I know but too well that his name *will* be woven into my life, whether as faithful unto death in sorrow, or worn with joy for ever. Adieu!"

She finished writing, and was about to close her letter, when a fresh thought struck her, and she continued: "It is said, not without some truth in my case, that the most important part of a woman's letter lies in the odd piece of intelligence she just remembers when it is about to be posted. I was going to omit telling you that I know nothing whatever about Mr Faithfull, except that Harry Nugent says he is a man of good means and family in the North; beyond this, he is so singularly reticent on all points concerning himself, that I do not know if he has a relation living. That he has been travelling for some time, is the single information he gives, and he is only warmed into communicativeness when on the subject of the countries he has visited. His reticence on other points is painfully tormenting, since it arouses all my curiosity to strive to fathom him. I sometimes think there is a mystery about him, for when he imagines himself unobserved, there comes into his face an expression of melancholy so profound, that it is with difficulty I restrain the longing I have felt at such times to snap the bands of conventionality, and ask him its cause; for, alas! as I have already told you, he sees but too well, I fear, that my heart is utterly his; and—but how can I describe to you the pain and shame of this disclosure?—the more he sees it, the more he shrinks from me. Does he despise me? I dread to ask the question of myself.

"It is positively inhuman to despise a woman for the offering of her soul's richest blossom, even if there is no heart left to pluck it. If he does not

care for me, I feel that I have done nothing worthy of his contempt, for I have simply loved him beyond the power of my will to control. Love, the lord of all, has taken the helm of my small bark, and while he holds the rudder in his hand, I shall be kept floating ever on *faithful* waters.

'How I can see you smile as you read this, and suggest to yourself the necessity of coming to stay with me for a little, as you consider my case such a bad one that I am hardly responsible. Come, dear friend; the Clytie has unloosed my speech, and made me tell you all. It is more than probable that I shall need you, for loving as are those about me, the fear of paining them, especially my dear mother, forbids my disclosing all I have written to you; and if the worst comes to the worst, and he goes away without a word, then, Amy, let me have you near me, that my heart may not be left to break utterly without sympathy. Human suffering has its depths, but I question if it has one, psychologically speaking, that will equal mine in such a case. Come, therefore, as soon as you can.'

Having at length written all she wished, she closed her letter, and sent it to the post. Feeling the vacuum left by the accomplishment of a pleasant duty, she sat back in her chair, and with her hands clasped across her eyes, indulged in a reverie.

Marian Elton was a girl of twenty-five; in all the glory of early womanhood: bright, fascinating, intelligent, and accomplished, she was the centre of attraction wherever she went. She had more than one offer; from rich men, who would have given their wealth to endow her; and from poor men, who only asked to toil for her. But she was a woman 'true to herself' in her determination only to marry whom she loved; and there was not a man among those she rejected who did not feel that they valued her more in her refusal of their love, than its acceptance, if that were possible; for it shewed them a true womanly nature, whose goodness converted their failure to win her love into friendship. She healed their wounds by making them feel, that though unsuccessful, they had not loved unworthily, which was flattering at least to their discernment, and upheld their self-respect; for if we are to be judged by the affections we aspire to gain, it is surely more ennobling to have aimed high even to failure, than to have sought and won only the inferior.

Her reverie was interrupted by a startling double-knock at the hall-door, and from her point of observation at the window, she saw that it was Leonard Faithfull who was calling. 'Should she receive him? Her mother was out. Perhaps he would not ask for her.' Further surmise was cut short by his entering the room. She found it difficult to speak to him; with her mind so intensely occupied as we have seen, calmness and an absence of self-consciousness were out of the question. Every nerve within her was vibrating so keenly that she felt cold and speechless with emotion. His embarrassment was scarcely less than her own, but it was the agitation of a man determined *not* to see or feel. They sat for some time making commonplace remarks about the weather and society, and then his eye fell upon the Clytie.

'Do you believe such constancy possible, Miss Elton? Do you think the woman lives, apart from mythology, who is capable of loving continuously where it is not returned?'

He asked the question pointedly, almost savagely, she thought. Her quick, warm feelings were so shaken by it, that she replied nervously: 'It is more a question of experience and principle than of opinion, I fancy. If a woman thinks she has loved worthily, she would be doing violence to her better nature were she untrue to her faith. I can quite understand the constancy of Clytie, who could not be satisfied with or give her heart to other than the sun-god. Once she had become penetrated by the rays of his perfection, how was it possible she could offer the tribute of her highest love and worship to any lesser light? Therefore, the Clytie for me is but the symbol of the truth, that constancy to what one considers the noblest, becomes the law of necessity.'

He held his eyes on the ground while she spoke, nor raised them once while she uttered, with pathetic earnestness, a truth he had made her feel all too keenly. He offered no reply when she finished, and a pause ensued, which he was the first to break in a voice which repulsed all tenderness, as he said with apparent carelessness: 'I am sorry Mrs Elton is not at home, for I called to wish you all good-bye. I resume my wanderings to-morrow, after having been a sad idler. This time, I am going west: I daresay you will hear of me as having come to grief in some of the wilds of South America. I fear I cannot stay until Mrs Elton returns,' he added hurriedly, with averted eyes. Unable to meet her look of agony, he opened his watch, and then, as if late, he said: 'I have several visits to pay, and must wish you good-bye, Miss Elton; kindly present my compliments and adieux to your family.' She was just conscious that he took her hand, had shaken it coldly, and was gone!—gone! without even one kind word or look!

'Oh, how cruel! how inhuman!' she exclaimed, as she flung herself into a chair, benumbed with an anguish that was tearless. 'He is unworthy!' was her first decision, which buoyed her up with relentless endeavour to fling his memory from her heart; but all in vain! He was the sun-god of her woman's worship, towards whom her gaze would ever turn; for the voice of her own soul, stronger than opinion, louder than fact, whispered she had not been mistaken, and that he was worthy of her homage; even though he left the blossom of her love to pine for ever on its stem.

#### CHAPTER II.

Five long years had passed, each repeating its story of the seasons, and still Marian Elton was unmarried. One suitor after another came and went, to the disappointment of her family and the wonder of her friends. Her faithful friend and confidant, Amy, alone knew the truth which her mother partially guessed when she used to say: 'That Clytie has bewitched you, Marian. I hope you are not grieving after some impossible hero. I declare, some day I shall enter into a conspiracy to throw her from her pedestal; you have never been the same girl since the day you bought her.'

To this, the only secret of her life, Marian offered no reply, for she knew her mother's

surmises were but too true, and she feared to pain her by confirming them.

It must not be supposed, however, that she was unhappy all this while—far from it. After the first wild burst of sorrow was over, she found consolation in duty, study, and the affection of those around her. To all these she returned with redoubled energy, and the result was, that at thirty years of age Marian Elton, so far from developing a tendency to old-maidishness, had ripened into a character of ennobled worth. The only problem people ever hazarded about her was 'why she never married.'

Occasionally, when alone with her Clytie, the old sorrow would bleed anew, as she thought of the past, and the similarity of their fate. But suffering, she argued, though differing in intensity, was the lot of all. There was no life without its hidden wounds, some scarred over by the healing hand of Time; others, again, that would never cicatrise; but one and all were bearing on their hearts some mark of painful encounter on the battle-field of life. Well is it for those who come forth from the strife 'perfected through suffering,' as did Marian Elton.

Her friend Amy had married so happily that she never wearied urging upon her to let go the past, and find consolation in bestowing herself upon William Blakeney, who, with exemplary patience, was proving the truth of his determination never to take her 'No' for an answer.

'It is positively cruel of you, Marian, to waste his life as you are doing, all for an idea! for as long as you are single he will never marry,' said Amy, who at this time was on a visit to the Eltons. 'It is now five years,' she continued, 'since that unfortunate craze of yours, and it seems to me you really are little short of a monomaniac, as you used to tell me to call you, to have preserved thus long the recollection of such an unpleasant abstraction—for he was nothing more.'

'Please, don't talk of my marrying any one, Amy. I am happier far as I am. Dear good Blakeney! I would do anything in the world to reward his kind faithfulness—anything, that is to say, but marry him. I have told him so repeatedly, and it is his own fault, not mine, that he continues as he does. But do not vex yourself about him; he knows my mind, and is content to be my very good friend.'

'Content! No! Resigned, you mean. He will never marry as long as you are single. I am sure he is only waiting to see what becomes of you.'

'Poor man! What unnecessary trouble do give himself on my account. I fear it will keep him occupied all his life; for this is a point upon which I am resolute, not from obstinacy, but necessity.'

'I begin to believe that your mother is right, and that yon Clytie has indeed bewitched you. You may depend upon it, Marian, that you are under a spell, which will not be broken until that unhappy little nymph falls a sacrifice. I have half a mind to be the priestess who shall deal her the blow.'

They were sitting together working in Marian's boudoir at the time, and the Clytie stood on a slight table near. Without the least intention of fulfilling her words, Amy pretending she was about to carry her design into execution, rose hastily in play, when her dress catching in a chair, she stumbled, and in her fall knocked over the table,

and the little image fell to the ground smashed to pieces!

'Oh, what *have* you done!' cried Marian as she sprang forward, too late to save her favourite. The tears were in her eyes as she picked up the broken fragments; and she looked reproachfully at her friend, unable, in her distress, to believe that she had not wilfully carried out her intention.

'I am so grieved!' said Amy with genuine vexation at the accident which pained Marian so visibly. 'Indeed, I was not in earnest about breaking it. I will get you another in Parian; this was only plaster of Paris.'

'Ah! it would never be the same,' she sighed. 'This one has been my companion since the first hour of my sorrow, and I have found strength in her companionship. Poor Clytie! No, Amy, no other model shall ever take her place.'

'I am so sorry. Still, if the spell be only broken, how I shall rejoice; I shall have done poor Blakeney a good turn, for which he will always bless me,' said Amy, smiling.

'You are adding insult to injury,' replied Marian sadly. 'Come; it is time to dress for dinner; the Nugents dine with us.' And her hands were full of the broken pieces of the Clytie as she was leaving.

'What are you going to do with them?'

'Bury them in a silken shroud in my drawer.'

'Was there ever such infatuation as yours, Marian! You have earned the name of Faithful with reference to the owner, and might inscribe it on your tablets without any permission of his.'

'Amy! hush! His name has never passed my lips since that day.'

'Never mind; the spell is broken at last, and there is hope once more for others.'

As it was only a family party, Marian, who had been indulging in some private grieving over the remains of her Clytie, was the last to appear.

'I've got some news for you,' greeted her on entering the drawing-room, from her cousin Harry. 'I had a letter just as I came out: from whom, do you think?'

'How can I tell, Harry?'

'Guess.'

'Impossible; you have such a host of friends.'

'No, I don't suppose you ever will guess, for I had almost forgotten him. I thought he was dead; I have not heard from him since he left us five years ago. You know now whom I mean—Faithful—he is in England.' There was an exclamation of surprise from all in the room but Marian, through whose frame the announcement passed like an electric shock, although she had sufficient presence of mind to listen passively. 'And he sent me the oddest piece of news in the world—that his wife is dead! I never knew he had a wife before.'

'Poor man,' said Mrs Elton sympathetically.

'Poor man! you may well say, when you hear the rest of the story. It seems he was married privately, some eight years ago, in Italy, and that his wife went out of her mind almost immediately after their marriage.'

'Then he must have been a married man all the time he was with us!' exclaimed Mrs Elton with dismay, not unmixed with thankfulness. 'How very extraordinary, not to say wrong of him, not to have told us. It is so dangerous when married

men pass themselves off as bachelors; they are nothing less than wolves in the fold, to my mind. Only think, if some of you girls had fallen in love with him!

'Well, I suppose he trusted to not making his attentions pointed enough to raise any question of that kind,' said Mr Nugent; 'and I can quite understand his not caring to talk about or publish such a painful fact of his life, especially as his marriage, it seems, was a secret one. Men, as a rule, don't like condolences on such events.'

'I suppose not,' said Mrs Elton, who, perceiving that her fold had escaped damage from such a calamity as might have overtaken it, was ready to be magnanimous towards the culprit, by admitting the excuses in his favour; and was about to let the subject drop, when Mr Nugent continued: 'He seems not to have forgotten the time he was with us, for he makes minute inquiries after every one, and wants to know who Miss Elton married.'

'Indeed, you can tell him, with my compliments, that Miss Elton has been very remiss on that point,' said her mother, smiling; while Marian, hardly knowing how she endured it all, remained silent, struggling with the faintness such strange tidings produced.

Amy, who alone saw and knew what she was suffering, came to her rescue at last by pretending she had forgotten something. As she was about to leave the room, she beckoned Marian to follow her.

'Bless you for this!' cried Marian, as soon as the door was closed. Rushing up to her room, she fought with her agitation until restored to calmness, and she could go among them again as though nothing special had occurred.

A week later, and Harry Nugent came one morning to tell her that Faithfull had accepted an invitation to stay with them. 'He begged particularly to be remembered to you, Marian, and expressed great surprise at hearing you were not married.'

To paint her feelings as her cousin thus brusquely touched upon her most cherished secret is not possible. She blushed crimson, and begged him to desist, as he rallied her upon what he termed 'her strange infatuation for single-blessedness.'

Meanwhile, in her heart, the sickness of deferred hope was blossoming into a tree of life! But for what? she asked herself. For nothing but the bitterness of a greater disappointment, perhaps; to find that she was as powerless to win him in his freedom, as his honour forbade him to be won in his bondage!

The thought of how, and where, she should first meet him, gave her uneasiness. What would he say? Would her tell-tale face betray her, or had the years which had passed brought her the power she before lacked? What days and hours of suspense, that fled all too quickly, and yet seemed interminable, through her mingled sensations of hope and dread, which longed for, yet dreaded the hour of meeting!

It was some days before the one fixed for his arrival, that she was startled one morning by having his card put into her hand by a servant, who summoned her to the drawing-room.

She scarcely knew how she ever reached or entered the room; she can only think that she must have turned deadly pale on seeing him, and that he read on her face the history of her faithful heart, which had been true to him throughout the years; for without being able to remember how

it happened, she found herself in his arms sobbing out her welcome.

'Thank God, you read me rightly, Marian!' he murmured, as soon as the first outburst of feeling permitted him to speak. 'Your heart must have told you intuitively, in years gone by, that, had I dared, I would gladly have returned the love I saw was mine; but not for worlds would I, at that or any time, have wounded your self-respect and sense of honour, by allowing you to know that you had given your heart to one whom it is counted a wrong to love. I judged it better, therefore, by my coldness, to wean, or even repulse you—though in so doing I left myself open to the pain of being charged with want of feeling and heartlessness—rather than leave you the double suffering of finding that you were beloved by one who was powerless to claim you. You know, I think from Nugent, one portion of my story; I will tell you the rest.'

'When in Italy, I married without the knowledge, and therefore without the consent of my family (from whom I wished to keep it secret), a lovely girl for her beauty, and found her temper, alas! owing to the latent seeds of madness, execrable. We had not been married very long before the disease became developed, and she was pronounced by the ablest doctors incurable. The passion her beauty inspired, her infected brain and temperament quickly exhausted, until I had soon no feeling for her but one of great pity, while I endeavoured to surround her with every care and attention that means could procure; but the love and companionship which is bound up in that most sacred word *wife*, was gone for ever.'

'I left her under medical care, and strove to forget my misfortunes, and avoid all questioning on the part of my family, by travelling; but it was not until I came to England and met you, that I knew *how* doomed was my life! May you never know what I suffered when I used to watch you pleading silently, with eloquent dumbness, for the affection I loved you far too well to declare; for I determined that no shade of dishonour should ever trouble the heart I had learned to reverence above all others on earth. But as soon as I was free, Marian, my first thoughts were for you. My first visit, on hearing from Nugent, is to you, to see if your heart is still, as I prayed it might be, all my own; and, ah! I have been well rewarded; for this meeting more than compensates for years of sorrow.—And Clytie! I have not forgotten her.'

'Broken!' she whispered, 'on the very day I heard of you again. She kept me faithful to my sun-god, and vanished only on his return.'

'When he came, to gather the rich blossom of your love, and wear it on his heart for ever!'

#### THE MONTH: SCIENCE AND ARTS.

At the opening meeting of the Epidemiological Society, Mr N. Radcliffe stated in his address, that the obscurity in which epidemic diseases were involved arose mainly from their having been talked and written about in a hazy way and in indefinite terms. But a change has taken place since Sir Thomas Watson said, some years ago, in one of his lectures: 'You will hear persons disputing about the term contagion; but such

disputes can only arise from the want of a distinct definition of the sense in which it is employed ; I understand a disorder to be contagious when it is in any way communicable from person to person.' Since then, medical men have discovered that there are different forms and modes of contagion ; and they now know that there is a difference between typhus and typhoid fever, that their modes of communication are totally unlike. 'This discovery,' said Mr Radcliffe, 'has prompted researches into the habits of particular diseases, which have shewn contagion acting widely on one hand on common inflammatory diseases which fall within the surgeon's sphere of duty, and on the other in certain wide-spread chronic maladies.' Hence it is that of late years there has been so much progress made in exact researches into the nature and habits of contagious diseases of all kinds. 'Recent astronomical and meteorological investigation,' said Mr Radcliffe, in concluding his address, 'have established a relationship between certain larger cyclical meteorological phenomena, and successions of good and bad crops with particular cyclical solar phenomena. Here is the clue for the beginning of an analysis of the cosmical relations of epidemics, of periods of dearth (relapsing and typhus fevers), and of epidemics most sensitive to meteorological changes (diarrhoea, typhoid, cholera). Such an analysis, so far as this country is concerned, has been made possible by the prescient labours of Dr W. Farr, F.R.S. (of the General Register Office), which, beginning in 1837, have been continued to the present time.'

Dr Van Buren of New York says something to the same effect in an American periodical. Diseases once classed together, are now recognised as distinct, as occasioned by different poisons. The poison of measles, for example, is different from that of scarlet fever, and the poison of small-pox is different from that of whooping-cough. With our advancing knowledge of the difference between typhus and typhoid, we learn that those diseases may be regarded as 'preventable.' 'Pyæmia,' remarks Dr Van Buren, 'is now distinguished from phlebitis, and established as a blood disease. In like manner there are, probably, diseases now grouped together and treated of in surgical works as identical (erysipelas, pyæmia, and diffuse cellular inflammation), which not many years hence will be recognised as entirely distinct in their origin and nature. It is worth while to remark that advance in knowledge consists, in a large degree, in learning to discriminate, or make distinctions, where before no distinctions had been recognised.'

Mr Moon has stated, in a communication to the Odontological Society, that the stump of a tooth may be preserved as the basis of an artificial tooth, and rendered painless, by leaving the root canal empty, and drilling a hole into it just below the free edge of the gum. This hole becomes a permanent vent, and thus saves the stump from disturbing influences, which, if deprived of means

of escape, would ultimately destroy it by a painful process.

It is known to agriculturists that nitrogenous manures favour the growth of abundant crops of grain, and yet the grain when ripe contains but a comparatively small percentage of nitrogen. On the other hand, leguminous plants, such as beans and peas, which grow best when treated with a mineral manure containing potass, and are 'almost abolished' by a nitrogenous manure, yield a very high percentage of nitrogen. This is a case worth inquiring into, and we learn from Dr J. H. Gilbert, that he and Mr Lawes have often felt that 'if they could determine the source of the nitrogen of the fungi growing in fairy rings, some light might perhaps be thrown on the question of the source of the nitrogen of the leguminosa.' They have made experiments and observations ; but have not yet settled the question. Meanwhile, an account thereof is published in the *Journal* of the Linnean Society, where it may be studied by any one interested in the subject. It is remarkable that one-third of the dry substance of fungi consists of nitrogenous matters. 'In fact,' says Dr Gilbert, 'fungi would appear to be among the most highly nitrogenous of plants, and to be also very rich in potass. Yet the fungi have developed in fairy rings only on the plots poorest in nitrogen and potass.' Such being the facts, 'the questions obviously arise, whether the greater prevalence of fungi under such conditions be due to the manurial conditions themselves being directly favourable for their growth ; or whether, other plants, and especially the grasses, growing so sluggishly under such conditions, the plants of the lower orders are the better able to overcome the competition, and to assert themselves.' It is in the hope of eliciting an answer to these questions that the subject has been laid before the Linnean Society.

It has been noticed in the United States that trees raise themselves, and seem to grow taller, when, in fact, they have done growing. The thickening of the roots was supposed to be the cause ; but Dr Lapham, botanist and State geologist of Wisconsin, has investigated the subject, and finds that frost exerts a lifting power on full-grown trees ; and his conclusions have been confirmed by observations made near Philadelphia. The way in which it shews itself is thus explained in a communication to the Academy of Natural Sciences in that city. What we know of the action of frost on growing plants, says the writer, is that, as farmers say, it 'draws out.' 'When the land freezes, expansion ensues, drawing the clover up with it, leaving, of course, a cavity from whence the root was drawn. When the first thaw comes, the liquid, carrying earthy matter, enters the cavity, and thus the clover root is prevented from descending to its original position. The same process takes place with trees. The roots, when once elevated, cannot descend to their original position.' These particulars have led to the suggestion, that 'one of the chief offices of the tap-roots may be to

guard the tree as much as possible from this frost-lifting.

Some members of the Academy are investigating the question, Whence do leaves get their colouring matter in autumn? The English oak, if planted in America, never assumes the gorgeous tints of American trees; and American trees, if planted in Europe, go on producing the rich colours just as when they were at home. The observers, at the present stage of the inquiry, are of opinion that the colour is produced by 'vital action of some sort,' and that it is not due merely to sunshine, air, or decay.

In a recent *Month*, we noticed the discovery of minute animals, rotifers, in the joints of pavements in Philadelphia. Here is a description of another small creature, *Gromia*, taken from the Proceedings of the Academy above mentioned. 'Imagine,' says Professor Leidy, 'an animal, like one of our autumnal spiders, stationed at the centre of its well-spread net; imagine every thread of this net to be a living extension of the animal, elongating, branching, and becoming confluent so as to form a most intricate net; and imagine every thread to exhibit actively moving currents of a viscid liquid both outward and inward, carrying along particles of food and dirt, and you have some idea of the general character of a *Gromia*.'

This complicated creature is a cream-coloured ball about one-sixteenth of a line in diameter, and it lives on the pavements. 'When placed in water, in a few minutes it projects in all directions a most wonderful and intricate net. Along the threads of this net (which are less than one-thirty thousandth of an inch in diameter) float minute naviculæ from the neighbourhood, like boats in the current of a stream, until reaching the central mass they are there swallowed.' Professor Leidy's observations lead him to conclude that during dry weather the tiny creature remains quiet in the dust, and that when rain falls it spreads its net and gathers food; and thus passes through periods of activity and repose.

Mercury in a watch-glass with a small quantity of very dilute sulphuric acid and bichromate of potassium, will, when touched with a needle, alternately dilate and contract. The explanation is, that a process of oxidation and deoxidation takes place. The same phenomenon may be produced by an electric current. This movement of the mercury has been taken advantage of as a motive-power in the working of a small machine. By the sinking and swelling of mercury in two cups placed in a trough of acidulated water, an up-and-down motion is originated, which can at pleasure be converted into a rotary motion. So feeble a current suffices to keep this machine going, that the suggestion has been made that it (the machine) may be employed as a very sensitive electrometer; and probably, though only a curiosity at present, it may be found available for other purposes.

Chemists have discovered further purposes of the metallic character of hydrogen—namely, that hydrogen will unite with potassium and sodium, and form a hydride of each of the two metals. These products are described as having a metallic lustre, and the general physical appearance of a metal.

Syrups are largely used in the United States, and it appears that there are certain manufacturers who, by chemical hocus-pocus, convert starch into grape-sugar, as a cheap way of getting a material

out of which they make the syrup. A Report on the subject has been published, and from this we learn, that of seventeen samples of sugar examined, not more than two were cane-sugar: all the others were concocted from the artificial product, and were found to contain many impurities—lime, sulphuric acid, iron, lead, and 'dirt' being among them. The use of syrups at evening-parties and in summer drinks is thus seen to be attended by disagreeable consequences; and in this fact we have another example of the employment of the arts for purposes of fraud.

And there are manufacturers who, in printing and finishing calicoes and muslins, make use of arseniate of glycerine and acetate of clay, instead of the usual harmless gum. The consequence is, that in every yard of those calicoes or muslins sold to customers there is a small amount of poison.

In Saxony, a method of hardening sandstone has been tried with success. The stone is soaked, in a solution of alkaline silicates and of alumina, which penetrate some inches, and impart so great a degree of hardness to the surface, that it will bear polishing, and has the look of marble. If exposed to great heat, the surface vitrifies, and may be coloured at pleasure.

A solution of castor-oil with two or three times its bulk of absolute alcohol, if spread on thin drawing-paper with a sponge, will make it transparent, and convert it into tracing-paper. The alcohol evaporates, and the paper is then ready for use. The drawing may then be traced in crayon or Indian ink. If then the paper is soaked in alcohol, the oil is dissolved and removed, and the sheet is restored to its opaque condition.

It is a common saying among sailors that heavy rain falling on the sea stills the motion of the waves—or, as they phrase it, the 'rain soon knocks down the sea.' Professor Osborne Reynolds, of Owens College, Manchester, has made experiments which demonstrate that the saying is founded on fact; for when drops of water fall on the surface of water, they not only produce the usual rings, but they drive some of the surface-water downwards in series of rings which increase in size. To replace the water carried down, some of the under water would have to rise to the surface. 'When,' says the Professor, 'the surface is disturbed by waves, besides the vertical motion, the particles move backwards and forwards in a horizontal direction, and this motion diminishes as we proceed downwards from the surface. Therefore, in this case the effect of rain-drops will be to convey the motion which belongs to the water at the surface down into the lower water, where it has no effect so far as the waves are concerned, and hence the rain would diminish the motion at the surface, which is essential to the continuance of the waves, and thus destroy the waves.'

The end of the year brings the time when meteorologists as well as merchants take stock, and sum up their annual accounts. Hence, we shall soon have particulars of the memorable rain-fall of 1875. It was in many places of the kind described by observers as 'torrential,' and not a few among them have had to record the 'wettest days' within their experience. In Oxfordshire and adjacent counties, nearly eight inches of rain fell in the single month of October; five inches more than the average. No wonder that floods prevailed!

## OUR OLD DOG JACK.

OLD Jack ! we scarce yet count him dead ;  
The unforgotten never dies !  
Though mound of earth with primrose set,  
'Neath hawthorn tree shows where he lies.

A faithful friend for thirteen years,  
Grateful for every kindness shewn ;  
And were there any fault to find,  
He ever held that fault his own.

No new friend came 'twixt us and him ;  
No fortune tried his fealty fast ;  
Come weal or woe, whate'er might 'tide,  
Old Jack was loyal to the last.

Had danger come, no thought of self ;  
No matter what the odds, a raid,  
To guard his household friends from harm,  
Upon a hundred he had made.

His gratitude, unwavering love,  
His patience, trust, outstrip who can ?  
His courteous ways to those he loved,  
For Jack was quite a gentleman.

O Darwin ! were thy theory true  
How great a race might walk the earth,  
When dogs, to full perfection brought,  
Had found Development's last birth—

Ay, whether pure, or mongrel cur,  
Such qualities in them abound,  
Which in the prouder human race  
Are, to our shame, oft lacking found.

Old Jack ! I sometimes wondering muse  
If that thy being can be o'er ;  
Or whether for the canine race  
Some planet may not be in store,

Where dogs may have a little peace,  
After rough life of kicks and blows,  
Scant meals, hard words, and shelter poor ;  
Some compensation for their woes—

And where the vivisector's knife  
May never meet their pleading eyes,  
For Science, blest with finer sense,  
Needs not the cruel sacrifice—

And though some scoff, and bid me drive  
As wild, profane, the theory hence ;  
I ask, why so ? Why should there be  
A waste of such intelligence ?

Look all around—no atom lost,  
Say, where do wonders cease—or lead ?  
How shall ye fathom out the end,  
Who the beginning cannot read ?

Ay, call it folly, if you will,  
Such idle lines as these to pen ;  
But truer friend than poor old Jack  
One finds not 'mongst our vaunted men—

Through love to him, the love I bore  
To all his kind took deeper root,  
And pleading dumb creation's rights,  
Shall be of old Jack's life the fruit—

Yes, long as I a pen can hold  
'Gainst cruelty a line to trace,  
Old Jack shall live in every line  
The benefactor of his race.

J. G.

## THE HOUSE-FLY.

The familiar house-fly (*Musca domestica*) is apt to be considered an unmitigated pest. It is therefore time to call attention to some recent investigations of a chemist, which go to bear out the pious axiom that everything has its use. This observer, noticing the movements of flies after alighting, rubbing their hind-feet together, their hind-feet and wings, and their fore-feet, was led to explore into the cause ; and he found that the fly's wings and legs, during his gyrations in the air, become coated with extremely minute animalcula, which he subsequently devours. These microscopic creatures are poisonous, and abound in impure air, so that flies perform a useful work in removing the seeds of disease. Leanness in a fly is *prima facie* evidence of pure air in the house, while corpulency indicates foulness and bad ventilation. If these observations are well founded, the housekeeper, instead of killing off the flies with poisonous preparations, should make her premises as sweet and clean as possible, and then, having protected food with wire or other covers, leave the busy flies to act as airy scavengers.—*Hardwicke's Science Gossip.*

Volume XII. of the Fourth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

An elegant cloth case for binding the whole of the numbers for 1875 is also ready.

Back numbers to complete sets may at all times be had.

Next Saturday, January 1, 1876, will be commenced in this JOURNAL, a NOVEL, entitled

## F A L L E N F O R T U N E S.
